As The Editor Sees It

Only the chronic pessimist can look the new year in the face and call it a bad prospect. The country has weathered the Presidential year just passed and though there was a certain amount of unemployment; depression in some of the larger industries; and the usual waiting for the election outcome, there has been no panic, no alarming slump in big business and stocks closed the year with sharp advances.

According to Secretary Hoover the annual survey of the Department of Commerce shows that the New Year begins with the economic structure of the world upon more solid foundations than at any time since the war. With the exception of a few spots of secondary importance there has been during the past year a real advance toward social, economic and political stability throughout the world. The only exceptions are Russia and China, which even before the war contributed less than 3½ per cent. of international commerce and, of course, a part of this continues.

Generally the world is producing more goods, there is fuller employment, there are higher standards of living, more assurance of economic stability for the future and more promise of peace than we have seen for many years. The world is by no means free from liability to economic shock, yet the forces today in motion all tend to great promise for the forthcoming year.

One of the most encouraging omens for 1925 is the stride toward recovery which has been made by the Agricultural Industry. This very important element in our economic structure was slower than other branches to recover from the effects of the war, but the outlook now in this direction is very favorable.

So far as Building is concerned, there was no falling off in 1924 in Philadelphia; on the contrary this city experienced the greatest building year in its history with a total of \$141,737,460 worth of construction.

With its wonderful facilities for Commerce; its huge industries and financial resources, Philadelphia is in a fair way to continue its building and business activity.

In summing up the situation Charles M. Schwab gives the following reasons for a belief in national and general prosperity for the new year:

In looking into the new year it seems there is every indication for a national and general prosperity throughout the United States such as we have not witnessed for several years. As reasons we have:

High wages for labor. As a whole, wages were maintained at constant levels last summer and fall, even in the face of considerably reduced production. With rates of production increasing, high wages will give a strong underlying buying power.

Good farm prices. The farmer's dollar has been low in purchasing power for some time. Increasing prices for farm products will mean good business for those industries that sell directly or indirectly to our great farm population.

Manufacturers have spent the last two or three years studying their costs of production and distribution with a view to enable the consumer to buy at the lowest possible prices. Unnecessary costs are being eliminated and methods of distribution improved. With even fair operations, manufacturers can show fair profits on their investment.

The railroads are recovering from the unusual stress put upon them during and after the war. Operating ratios are again in proper relation to income. The railroads are putting larger expenditures into upkeep, which means a demand for a wide range of manufactured products. The public is beginning to have more confidence in the management of the railroads. The railroads are providing a service which deserves the support of every business man and wage earner in the country. The management of the railroads is to be congratulated upon the attention given to reduction of costs of transportation by making the most effective use of every mile of track and every freight car and every man's time.

Experts predict that the total volume of building will continue at somewhere near its present levels and that automobile

production will be equal to, if not beyond, the large figures for 1924.

The American people showed by their vote in the November elections that they were in favor of government along the safe and sane channels that have been tried by time and found true. This edict of the people has given both confidence and impetus to business men all over the country to go ahead with production and normal expansion.

A business structure built on activity in every industry means national prosperity and good times.

The natural resources of the United States are incomparably greater than those of any other country in the world. God has endowed us with a patriotic people that will make use of these resources. The questions of the war have been forgotten. Aristocracy today is not made up of the men of wealth, birth or position. The real aristocrat is the man who does something good for his fellow men.

The United States is going to be the real workshop of the world.

ABOUT BETTER BUILDING IN GENERAL

Observations Concerning Needs of the Industry

BY CHARLES G. EDWARDS

President, Real Estate Board of New York

I THINK there can be no doubt of the fact that in this country, as a whole and careful survey would disclose the fact, that an appreciable portion of construction of all types not only in great centers of population, but in small communities, is not what it should be. Just how great this proportion would be I am not prepared to say; but I think we are all agreed that it is large enough to justify the concern which the American Construction Council feels in this respect.

In discussing this subject of the need for better building and the responsibility for poor construction, we must pause long enough to pay a tribute to such good building as we have, to those who are responsible for that.

New York City certainly furnishes many notable examples of the finest type of construction—in public structures, office buildings, apartment houses and other kinds. Other great cities of the world may as a whole be pronounced more artistic, but I believe that in no other great city has the combined effort of the daring capitalist, the inspired architect, the resourceful constructor and the skillful building engineer, conspired to produce these marvelous results, which in not much more than a decade have made New York the wonder city that it is.

Unfortunately, as we have agreed, not all of the thousands of buildings that go to make our own metropolis are the type I have just referred to. We do need better buildings. We do need higher standards—a greater pride in turning out a fine product. And more particularly do we need these as an anchor to hold us fast and secure against the tidal wave of construction which now and again all but overwhelms us—as for instance the one from which we are just now emerging.

This brings us to the question of responsibility.

Whose Fault?

Who is responsible? The question should take a different form. What elements in the community—in all the communities which suffer from the disease of faulty construction—are responsible?

It is not a pleasant thing to fix responsibility and I am not pretending to do that now, but merely to indicate that if it is the purpose of the American Construction Council to discuss the subject with a view to remedying the condition which it has stated exists, then all of the factors in the problem must be given their due consideration.

There is the architect. He designs the structure, provides the specifications, follows through, and knows pretty well what is going to happen. True, he is conditioned by the instructions he gets from the owner, but he can do much to help in the ultimate turning out of a good product.

Those who manufacture the materials and equipment that go into our buildings have a large responsibility. There are grades of material, of course. The manufacturers must cater to their market. All builders and constructors cannot afford the best, but those who manufacture can see to it that their product is a fine product and the best that can be made for the price asked.

The constructor is an important figure in the group that contribute to produce a building. He can skimp or he can give value which is the equivalent of what he is to receive for his work.

The workman is not a mere automaton in this business of manufacturing buildings. He can do good work or bad. He can loaf on the job and pile up a wage item to the extent that tempts those in the scale above to skimp on other items; or he can do his best.

There is the public official's responsibility. He can, in the interest of his employer—the City acting for the taxpayers—see all that should be seen and insist that proper standards be adhered to; or he can keep only one eye open and see very little with that. He is sometimes overworked and underpaid;

I. water pipe. Contract No. 732, furnishing and laying 6-inch, 8-inch, 12-inch C. I. water pipe. Contract No. 733, furnishing and delivering pig lead.

The valuable man in any business is the man who can and will co-operate with other men. The foreman who opposes the introduction of a new man into an institution and fights every innovation which he himself does not suggest, is doomed to a gradual and creeping defeat. Men succeed only as they utilize the services and ideas of other men. Co-operate!

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., Jan. 2, 1925. SEALED PROPOSALS will be opened in this office at 3 P. M., Jan. 30, 1925, for remodeling and enlarging, including incidental changes in the mechanical equipment of the United States Post Office at Fulton, N. Y. Drawings and specifications may be obtained from the Custodian of the building, or at this office in the discretion of the Supervising Architect, Jas. A. Wetmore, Acting Supervising Architect.

(Continued from Page 4)

but his responsibility—and he has accepted it—is great.

There is the lender's responsibility. You cannot make bricks without straw nor build buildings without money. Lending institutions, Savings Banks, Trustees representing Estates, Attorneys representing owners of loanable funds—all can to a certain extent be assigned a share of responsibility for bad construction. And it is here that I wish to lay emphasis on what I believe to be the greatest factor for evil in what faulty and poorly constructed buildings we have today.

A New Fashion

Large reservoirs of capital have in past years paid little heed to the need of money for construction, preferring to invest their funds in stocks and bonds and other securities more liquid in their character than Real Estate Mortgages, with the result that the borrower found it difficult to obtain financial assistance and then only in very limited amounts. This situation has brought into the field a new fashion in real estate. The mortgage bond and such bonds are now being sold in vast quantities throughout the land. Companies have been organized to loan on bond and mortgage and to sell bonds against these mortgages. Some companies guarantee the principal and interest with all of the resources of the company behind them while others sell at a higher rate of interest and do not guarantee either principal or interest. Many large issues of mortgage bonds are underwritten and sold by brokerage houses formally confining their efforts to the sale of stocks and bonds only. It is to the latter concerns that the speculative builder usually appeals for funds with which to finance his building enterprise. The speculative builder needs money in larger quantity; he has less of his own money to put into any building and he must if he cares to stay in business, spread that small capital over various

operations. Therefore, his need of a loan larger than a conservative bank or insurance company will make, takes him to an underwriter.

Two Considerations

With the underwriter the first consideration is how quickly can the bonds be sold, but the second, and I think most important consideration to him is, how much can we charge for making the loan. If the builder needs more than can be reasonably and safely loaned, then a higher charge is made for underwriting. Appraisals are made at the borrower's expense to fit almost any reasonable need. What concern has the underwriter for the quality of the materials that go into the building; who supervises the construction as it progresses; what cares he if insufficient bolts are placed to care for wind resistance. What cares he if brick is used for fill instead of cement, nor for the many substitutes that are used? But the speculative builder cares. He has paid dearly for his financing. His only hope lies in a saving here and a saving there in cost of construction, so he proceeds to use substitutes to make this do where better would last longer. He is building to sell and can get his price and profit on a completed building that has cost considerably less to build than stated in his application for a loan. The cost of financing has made it necessary for him

to sacrifice quality. This speculative builder who provides little of the capital and borrows most of the rest for the building he expects to pass on to the investor has a large share of the responsibility. He knows what he wants. He knows what he is figuring on as a margin of profit over cost of production, and he determines to a great extent the course of action to be followed by this unjustifiable cost of financing.

I might be accused of partiality if I did not include the real estate broker in this fairly long category of those who are in varying degrees responsible for poorly constructed buildings. So I shall include him. But I do not think he plays a very large part.

This opinion is not the result of prejudice; nor because he is any different from the others. The average is about the same as that of the others. But he has not very much to do with it. He comes in late in the performance. He can discourage those who come to him to negotiate loans on poorly constructed buildings; he can decline to list poorly constructed buildings; if he takes them for sale he can keep them, so to speak, under the counter and display them only as a last resort—"as second hand goods." But this is about all. The damage was done when the building was built and the varying responsibilities of all those

concerned in its construction had already been assumed and discharged.

In some things the fixing of responsibility is only a short step from the remedying of the evil. In some others it is only the beginning of trouble. What it is in the case under consideration I am not prepared to say. But it is obvious that if the American Construction Council is concerned about the matter it can make a beginning with fair prospects of good results, for the Council has officers and members of national prominence, that its membership is spread pretty well throughout the United States and—that in this membership are included all of the elements I have mentioned as having in a greater or less measure, responsibility for dishonestly constructed buildings.

This membership, I also notice, is divided into two groups. Perhaps, in due course after a proper procedure has been laid down, each group could make a beginning towards working out its own salvation and so accomplish ultimately as a combined effort of all the groups, the solution of the problem of bad construction. But do not be discouraged. It is amazing how many mountains of effort in matters of this kind it takes to produce a few small mole-hills of results. Yet it is worth while. The one thing certain is that if you do not make a beginning your

COST OF CONSTRUCTION

problem will remain the unsolved problem it is.

Address before the annual meeting of the American Construction Council.

COST OF CONSTRUCTION

The construction industry has shaken off many of the effects caused by the war and is now enjoying a marked degree of stability, according to conclusions drawn from statistics for 1924 compiled by the Associated General Contractors of America. (See attached chart.)

Unlike any year since the beginning of the war, 1924 found construction costs holding practically a single plane throughout the entire twelve-month period. An almost total absence of seasonal fluctuations is noted, with the average of costs for December remaining at the index number 201. The average for the entire year was 202.

Although the volume of construction in progress, as indicated by shipments of construction materials, fell off approximately twenty points during November, it was greater than the total shown during the corresponding month of any previous year. The November index is 155 and the total volume for the first eleven months of 1924 is 3 per cent. higher than the figure for the same period in 1923.

Labor rates have remained level since July. The December average in twelve principal cities is 122 per cent. above the average for 1913. Compared with 1923, the average labor rate for 1924 was 6 per cent. higher.

The average prices paid by contractors for materials during 1924 was about 4 per cent. less than during 1923.

ESTABLISHING SAFETY IN BUILDING

Some Thoughts Concerning Accidents To Workingmen

BY W. F. AUSTIN

President, W. E. Wood Co., Detroit, Mich.

Much time and thought has been given to discussion of the laborers lost to the construction industry because of accidents and fatalities and the restriction in immigration. It is well to give no less notice to another phase of the situation.

A questionnaire was sent out recently in an effort to ascertain why young men do not enter the building trades. Answers to that questionnaire indicated a great many native-born American young men avoid the building trades because of the hazards and also the fact that they would be obliged to go to and from work in their working clothes.

Handicaps Exist

We are in competition with the manufacturing industries for men. We are faced with a restriction in immigration, and in addition to conserving our labor and our supply of men by safety measure, we can increase that supply somewhat by inducements. The average construction foreman, perhaps you will agree with me, would pooh-pooh the idea of locker rooms and washrooms for workmen on building construction operations, however large. But I will predict that in the near future if we are to compete with manufacturers, for labor, on our larger operations we will be providing those facilities for men.

Referring to the employers in the construction industry, generally, we may proceed by considering the matter from two different angles with the earnest desire that what we shall do here and what we shall say will be of value in establishing safety work more generally in the construction industry.

First: to establish safety it is necessary to sell the idea to the principal and officials of your company. This has been done very largely and is being done by the National Safety Council through their publicity, the Congresses and their campaigns in different cities.

I think it would be safe to make a statement that perhaps in the construction industry fewer of the principals, fewer of the officials of the companies have been sold, than in some other industries. We propose through the A. C. G. of A., and through the continued activities of the Construction Section to sell more of the officials, more of the bosses this safety idea, because without that, it is almost impossible to make very much progress in this work.

A State of Mind

Because safety is a mental attitude and is a matter of instructions and education, eternal vigilance, and a matter of instinct reason on the part of those actually exposed to the hazards, let us review some of the things that can be done to educate, instruct and keep before our workmen this safety matter. In other words, some of the things that can be done to keep the mental attitude as nearly right as possible.

One of the first suggestions that might be made in this connection is to try to get away from the word "safety." "Safety" is an absolute term, somewhat overworked and does not find favor with the old school, practical, hard-headed construction man whose experience and training has taught him that in construction work certain chances must be taken. It might be better to label this activity "accident prevention work." Construction work can rarely ever be carried on with total safety, but no one will deny

that prevention of accidents on construction work is desirable and practical from every standpoint and your hard-headed, practical foreman and sub-foreman, at least some of them will listen to arguments in favor of accident prevention with more patience and less prejudice than to arguments on safety.

I think it would be well to review or recall some of Mr. Kettering's remarks in this connection. Those who heard him will remember he explained this safety work as similar to hooking an engine to a train. This locomotive of enthusiasm, of serious thought, of discussions, that we have here in Louisville now, must be backed up. It must be backed up and hooked on to the train of your routine work at home. It must be hooked on to your actual operation. It must be hooked on to your jobs through your foremen in order to be effective.

Pivots on Foreman

In other words, what we say here and what we do here, in order to be really effective, must mainly filter through to the man subjected to the hazard. So, after all, we have to get back to the foremen for the work, and make the foremen feel the responsibility for the accidents. In order to do that you certainly have to talk to the foremen in their own language, and it is suggested that accident prevention work will fit the situation with him better than safety work.

Another requisite for the establishment of safety or accident prevention work is to get a report of each and every accident so as to be able to make a study of how accidents are caused and what they cost. These reports should be tabulated by the standard method adopted for this section and the whole Council, so that comparisons may be made. This matter of reports is important as they furnish the facts upon which a great deal of the work must be planned and done.

Accident prevention work in the construction industry can be materially aided and very much accelerated by close co-operation between insurance carriers and employers. There are innumerable ways in which the insurance carriers can help to reduce accidents. Posters, danger signs, and other placards supplementing those furnished by the National Safety Council can be gotten up by your insurance company and distributed. These, if used intelligently, will constantly remind your employees and the public of certain specific dangers on your work as well as indicate generally to your employees the necessity of such matters as precaution in engaging men for construction work, accuracy in making reports, and other very necessary general requirements.

An accident prevention committee composed of your foremen, superintendents, time keepers, clerks and work-

men is another requirement. This committee should meet at least once a month and discuss freely and openly all of the practical aspects of the work, should review the accident reports, and make such comparisons as are desired.

The Group Plan

In this fourth suggestion for establishing safety, the group plan is what we have in mind. An accident prevention committee in the smaller organization is impractical, but in a group organization it is not only very practical but very helpful.

Some kind of a set of safe practices or code should be prepared, preferably by a group of constructors in your locality or in your state. This code or set of safe practices should not be too technical, should not be mandatory, but should be very practical, should especially conform with those customs and conditions peculiar to your locality, and should cover those general requirements which will reduce accidents on construction work. In order to be effective, this code should be distributed generously to all of those actually in charge of the operation after which questionnaires on the code should be sent out periodically to those having the work in charge. This questionnaire would indicate, when answered, the familiarity or lack of familiarity with the code. In order to stimulate this activity prizes may be offered for the best answers to the queries in the questionnaire and awards be made to the men. This is one very effective method of compelling your men to think accident prevention.

Must Take Lead

Unless something of this kind is done there is a very great danger that the code will not be read. And the construction industry must take the initiative in this matter before legislation is passed in many of the states requiring numerous, impractical, technical, highly detailed and costly measures which will only operate as an added burden to the construction industry and which are more or less questionably effective as accident prevention measures.

Sixth: Accident prevention work in the construction industry should include a careful, periodic inspection by a capable, impartial, trained engineer usually known as a safety engineer or inspector. This man must be peculiarly adapted for the work in that he must not incur the enmity of the man actually in charge of the operation but must demand his co-operation. His requests must not be arbitrary nor too insistent, otherwise he cannot expect to get anywhere near 100 per cent. co-operation or results. If he is the right kind of man and if he has the support and backing of the officials of your company, a great deal of good will result and a great many accidents will be prevented with-

out added expense, inconvenience or friction in your organization. This safety engineer or inspector should be a member of the accident prevention committee and should engage in all of its deliberations and activities and should have a very prominent part in the preparation and the making of the code or set of safe practices for your locality.

Seventh: The more serious accidents and all of the fatal accidents on your work should be subjected to investigation by a board of inquiry composed of a few members of your safety committee. This board should review carefully and impartially the causes leading up to the trouble and report its findings only in such manner as will tend to prevent and avoid a repetition of the accident. This has been found to be of great value in accident prevention work.

Finally: What the construction industry seems to require is the incentive or initiative to enter vigorously into this activity. We have all acknowledged that it is woefully behind other industries in this work, but we are ve encouraged by the interest and spirit and vigor of the last year and it only becomes necessary for those of us who know of the necessity and the desirability of this work to continue on and to work harder to convince others in our industry that they should become interested—yes, that they must become interested in this work.

The Present Difficulty

The difficulty up to this time has seemed to be to devise a plan whereby the average and the small construction firm can take an active part in this work. It may be taken for granted that the larger concerns are able within their organization to engage to a more or less extent in some kind of accident prevention activities. But it is most desirable that these larger concerns all should come into the Construction Section so that they may derive the benefit of the exchange of ideas and the co-ordination between their work and that of some other of the larger concerns which cannot be secured in any other way.

Now as to the average, or the smaller operator. It would seem, after studying this matter for some years that it is almost necessary that they join or affiliate themselves with some organization which can, in turn, function through the Construction Section of the National Safety Council. Let me suggest that in order to engage in this work that the smaller constructors affiliate themselves with some organization, either the local chapter of the Associated General Contractors of America, the Builders' Exchange, the Master Masons' Association, the local Safety Council of the Board of Commerce or some other group, for it has

been demonstrated conclusively that this accident prevention work can be done very much better in groups than by individuals.—*The Constructor*.

HOW WOOD LOSSES OCCUR

Decay, the Principal Cause, Can be Prevented by Using Treated Wood

BY DR. REGINALD H. COLLEY*

Pathologist Office of Investigations in Forest Pathology, U. S. Bureau of Plant Industry, in Co-operation With the Forest Products Laboratory

Regardless of differences of opinion as to when our supply of standing timber will be exhausted at our present rate of cutting, there is no doubt whatever that the depletion process has gone as far as we dare let it go. Conservation is, or ought to be, beyond the sentimental stage. Wood, we believe, will never be as scarce in this country as it is in lands where the forests have long ago disappeared, but the cut-over, heavily populated States are already feeling the pinch of a timber famine.† Each user of wood in any form has, therefore, an individual responsibility—a sort of national forest policy all his own—to secure from wood the greatest practical utility possible. By doing so he helps to hold off the felling of fresh timber to supply his needs.

The normal life of wood can be estimated only in the broadest terms. The reasons are obvious. Some woods are naturally more durable than others and last longer under similar service conditions. As a general rule heartwood is more durable than sapwood. Even the durable woods sometimes give out in a relatively short time if they are exposed to particularly unfavorable conditions. Wood which is kept dry will last for centuries—witness the furnishings in the tombs of ancient Egypt's kings—and wood which is kept thoroughly wet will last for geologic ages. In other words, the kind of wood, the kind of service and the conditions of service determine the period of use which may be reasonably expected. The wood fulfills its purpose if, with reasonable care, it gives the greatest practicable use in service.

Gradually the havoc wrought by wood-destroying insects is becoming better understood. There is one process, however, less appreciated by the average man, which destroys more wood annually than any other, possibly more than all of them put together—the insidious, constantly working process of decay.

*Extract from paper presented to the U. S. Senate Select Committee on Reforestation.

†See "Timber: Mine or Crop?" Separate No. 886, U. S. Department of Agriculture Yearbook, 1922.

Decay is caused by fungi. These lowly organisms attack wood in all such forms as lumber, logs and posts, and the result is—rotten wood. Perhaps that is overstating the case a little, for there are really two main types of fungi which attack wood—molds and wood-destroyers.

The molds include such organisms as the blue-stain fungus, which discolor wood. They are individually minute, but in masses they appear as bluish, blackish or variously colored "molds" or "mildews" on the surfaces of infected stock. As a rule they do not seriously injure the substance of the wood, but they often reduce its quality.

Wood-destroying fungi, on the other hand, produce more or less conspicuous fruit bodies commonly called conchs, or brackets, or toadstools—which, however, usually do not appear until decay is well advanced. They break down the substance of the wood and in the end make it absolutely worthless.

All wood is exposed at one time or another to the possibilities of attack by one or both of these types of fungi. In the first place, millions of board feet of our standing timber are rotten. Many butt logs are too defective to be worth removing from the forests. Let us assume that only the reasonably sound logs are hauled to the siding, mill, or storage yard. There remain innumerable chances for infection. The attack may take place while the wood is in log form; after it is cut into lumber and stacked for air seasoning; after it is in place in buildings; or during its period of service as a wooden article or wood product. The amount of deterioration varies, of course, in the different commodities.

The length of service obtained from a railroad tie, a telegraph pole, or a piece of mine timber depends partly on the conditions of service and partly on the time it takes for the wood to rot. The decay factor is the more important in most situations, because when weakened by decay the tie-rail cuts, the pole breaks over, and the mine timber buckles under the load. The end of the service period arrives earlier than it should because the strength of the wood is reduced as a result of fungus action.

Lumber and dimension stock of all kinds are subject to deterioration as a result of fungus action from the minute they leave the saw. Blue-stain fungi attack the sapwood of many species during the air-seasoning process; lumber rots in the storage yard and in the storage shed††; bridge timbers, trestles,

river wharves and piers, and many other rough outdoor structures simply crumple up after a comparatively few years' service. In certain warm, humid sections of the country the decay of lumber in buildings is a very serious problem.** Flooring and sills sometimes go out in six months. Rotten porches, steps, eaves, siding, window frames, floors, floor timbers and sills can be found anywhere in the United States. Individual cases may not be of much consequence, but the total amount of wood needed annually in the country for repair work is obviously very large.

The chances for decay can be reduced to a minimum by attention to details of construction and by the use of treated wood.

**See Humphrey, C. J. The Destruction by the Fungus "Portia Incrassata" of Coniferous Timber in Storage and When Used in the Construction of Buildings. Southern Lumberman, Vol. 49, No. 3, p. 36, Feb. 1, 1923. (See also Wood Preserving News, Vol. 1, No. 4, pp. 65-67, May, 1923.—Editor.)

BETTER MATERIALS OF CONSTRUCTION

Those who are fully acquainted with the durability and economy of preserved wood in engineering construction will be interested in the following editorial remarks of the Engineering News-Record, which urges the civil engineer to use and demand the best structural materials.

Most fields of production to satisfy the world's wants have registered a remarkable advance during the last 25 years. Methods and materials have been developed to a higher level, and costs have been reduced. Little or no advance is perceptible in the field of materials of construction. The quarter century has brought no change in efficiency of the major materials used by the civil engineer. Wood, steel, cement and the like are substantially the same in kind and quality as they were at the beginning of the century. Their production and distribution have come under more systematized control, with perhaps some minor influence on cost, but the materials themselves show no advance. The condition is curiously out of harmony with the continued forward movement in other lines of materials.

It may be that this absence of progress indicates that the civil engineers' materials have reached their highest point of perfection, since obviously there can be no better than the best. But this is quite improbable, and few users of any

one of these materials would be ready to admit that the acme of quality and variety has been reached. It is much more likely that the arts which produced the materials of construction have been marking time in technical respects, being so much preoccupied by the routine of production and marketing that no tendencies to develop advance could make headway.

If this is the case, the production of engineering construction is distinctly out of step with other technical activities. Lack of advance in materials is bound to mean lower efficiency and higher cost of the final output as compared with other fields of production. Is it possible that this condition is related to the fact that building costs more than anything else today—that it is at a level of 1½ to 2½ times the pre-war cost?

Improvement of quality is usually the result of two factors, competitive pressure of business and the natural seeking of men of brains to do their work constantly better.

Some recent movements suggest that the stationary period may be drawing to a close, however. Active study of lumber grading to give better quality and more complete utilization of the forest is an instance of a general mustering of forces for a new advance.

Both the static condition of materials production during the past quarter century and the reawakening of the spirit of improvement are attributable to some degree to the engineer, who makes use of the materials. Whenever the user needs an improved material and insistently demands it, the producing industry is very likely to supply it sooner or later; while the absence of a demand from the user will tend to encourage lack of progress by the producer. Had there been sufficiently urgent demand from the field of engineering, therefore, it is likely that advance in the quality of materials would have continued, as a response to this demand. The engineer has been largely occupied with his own problems, and remained content to accept the current qualities of materials as wholly adequate. Correspondingly, the awakening demands from the circle of users for better materials of construction has been a direct influence in bringing about the new movement.

If the development of construction materials is about to be resumed, therefore, the civil engineer as user of these materials has a part to play in maintaining and guiding this advance. His direct participation in the work of the advance is important. By giving expression to his demands for better quality, and taking advantage of each step of advance as soon as the producer makes it available to him, the engineer will assure the certainty of progress.

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

with Gas—Most Efficiently with

BRYANT AUTOMATIC
Hot Water
STORAGE SYSTEMS

The Bryant System is *unapproached* in ability to put a large percentage of the available heat into the water and *unequalled* in all 'round service.

It embodies: *capacity* to meet demands in excess of maximum requirements; a principle which maintains the initial pressure until all faucets are turned off, and *dependability* based on simple, rugged construction.

It is, in every respect, a system that is far above the average and equal to the most severe demands placed upon it.

As The Editor Sees It

THE estimated cost of all buildings, alterations, additions, repairs and miscellaneous work in buildings for which permits were issued by the Philadelphia Bureau of Building Inspection for 1924 was \$141,737,460, according to detailed reports printed on other pages of this issue of the GUIDE, an increase of \$19,086,525 over 1923, which, before 1924, was the greatest record of any year.

Dwelling Construction shows an increase in 1924 of 4,121 houses of all types over 1923 at an increase in estimated cost of \$8,447,855. Philadelphia was 21,423 houses short of requirements at the beginning of 1924. This year the increase of 2,867 over the average number, 7,150, of houses built annually heretofore has reduced the house shortage in Philadelphia to 18,556 houses. 10,017 houses of all types were built in 1924 and only 5,896 were built in 1923. As is usually the case, the greatest volume of any class of buildings started in 1924 was in residential buildings, \$57,773,225, compared to \$49,325,370 expended in 1923 for residences. Next to residential construction, Power houses showed the greatest value, as \$12,659,000 was the cost of buildings of this class. This was due to the enormous new plant of the Philadelphia Electric, a permit for which was issued in August at the estimated cost of \$12,000,000. Power houses showed an increase over 1923 in

value of \$12,380,900, although an increase in number of only two. Office Buildings came next in volume with 38 new structures, costing \$10,141,100, a decline of 3 and a drop of \$2,375,100 in value. Tenement Houses were next in order with 101 costing \$8,883,000, a considerable increase over 1923, when 66 tenement houses, costing only \$4,086,840, were started. Garages, with 2,778, costing \$6,951,430, followed, although only an increase of 256 over the number built in 1923; 2,522 costing \$5,415,885. Manufacturing next on the 1924 list showed a great decline over 1923, 80 costing \$7,680,400 were built in 1923, and only 59 cost \$5,873,735 in 1924. There was one more school started in 1924 than in 1923, although the 15 schools in 1923 cost \$7,212,315, and the 16 in 1924 cost \$4,394,435. Club houses followed with \$3,008,650 for two buildings of this class in 1924, whereas in 1923, 5 club houses cost approximately the same as was expended in 1924, \$3,155,185. Stores, next in volume, with 101, costing \$2,796,050, show an increase over 1923 when 67, costing \$2,296,550, were begun. Next came Churches, with a surprising increase in number, from 9, costing \$633,500 in 1923, to 27, totaling \$2,620,850 in 1924. This shows that Church advertising is paving, or the religious sentiment of Philadelphia is increasing; a praiseworthy accomplishment, no matter how or why achieved.

March exceeded all months in the number of operations started with 3,322, although the banner month in point of value of new work was August with \$23,047,300, the greatest record for August in the history of construction in Philadelphia.

Estimated Cost for Each Month 1924

Month	Permits	Operations	Estimated Cost
Jan.	884	1,249	\$ 8,642,525
Feb.	956	1,454	7,173,885
March ...	1,610	3,322	15,756,560
April	1,582	2,675	18,946,260

More garages have been built in 1924 than in any previous year in the history of construction in Philadelphia. The official records of the Bureau of Building Inspection show that 2,778 garages have been built at an estimated cost of \$6,951,430.

Record for Ten Years

The number of garages, with estimated cost, for the last ten years follows:

Year	No. of garages	Cost
1915	595	\$ 723,260
1916	878	1,307,340
1917	833	1,296,310
1918	480	833,320
1919	1,322	2,726,540
1920	1,153	2,502,290
1921	1,569	3,505,695
1922	1,909	5,072,765
1923	2,522	5,415,885
1924	2,778	6,951,430

April Leads This Year

The most active month was April, with 314 structures, while the next active month was October with 308 buildings. The totals in all the other months have been above the 200 mark, excepting January, February, November and December.

The total number of garages erected this year, according to permits issued by the Bureau of Building Inspection, follows:

Month	No. of structures	Cost
January	148	\$ 598,780
February	137	476,825
March	227	587,815
April	314	725,560
May	303	570,575
June	292	629,180

July	264	780,860
August	223	482,510
September	232	492,385
October	308	713,990
November	189	546,615
December	141	352,335

Total 2,778 \$6,951,430

The Forty-second Ward with 2,689 dwellings erected in 1924 led all districts and built twice as many residences as the next largest district in, house construction, the Fortieth Ward, with a record of 1,131. In 1923 the Forty-second Ward built 2,441 dwellings, over three times as many as any other ward.

Reports from over all the country show a marked increase in building in 1924 over 1923. 12 per cent. was the average increase over the country. Philadelphia showed an increase of over 15 per cent. Construction activity continued at a fairly even pace throughout the year.

Contemplated new work for 1925 shows a tendency toward public works, utilities, industrial buildings and the smaller types of residential buildings. Some new office buildings are being planned for Philadelphia, a large program of school construction and miscellaneous work in course of planning assures the Building Trades continued activity for some time.

All live men are advertisers, and the only man who should not advertise is the man who has nothing to offer to the world in the way of human service, and such a man is a dead one, whether he knows it or not. Advertising is a legitimate and ethical proposition. Life is too short for you to hide yourself away, mantled in your modesty, and let the world hunt you out. Even the dead are advertisers, for on visiting a beautiful cemetery the other day, I noticed that on nearly every marble slab was given a list of the virtues, talents and beautiful qualities which the dead man was supposed to have carried in stock. This is what you call non-productive advertising, or advertising from an emotional standpoint.—Elbert Hubbard.

Heated by Two No. 5-40
Novelty Carburetor Boilers,
rating 3700 Sq. Ft. each.
Vacuum system.

Residence of James A. Trowbridge, Noroton, Conn.

Architect: Electus D. Litchfield & Rogers,
477 Fifth Ave., N. Y. C.

Heating Engineer: H. Hall Marshall,
37 W. 43rd St., N. Y. C.

Heating Contractor: Richards & Jessup Co., Inc.
Stamford, Conn.

Another Notable Residence Superbly Heated

A thing of gleaming beauty in the morning sun and an architectural vision under moonlit skies, the Trowbridge residence is the fulfillment of the kind of commission architects dream about.

The site itself was an inspiration—a point of land enhanced on three sides by rolling beach and the sapphire waters of Long Island Sound.

The client wanted perfection and was able and willing to pay for it.

In selecting the heating system for such a residence—exposed to sea-borne winds—absolute comfort was *sine qua non*—and the Novelty Carburetor Boiler installed makes it a certainty.

A side-feed, sectional boiler, the Novelty is admirably adapted to large buildings. The Carburetor Chambers (one to each section) on the rear of the boiler, automatically mix all smoke, gases and carbon with oxygen from the air and burn them. The air enters top and bottom slots in the rear of each carburetor, as shown in the picture. *No adjustment of air intake is necessary. Rate of combustion determines amount of air required.*

Address Dept. BG 1, for illustrated and descriptive booklet giving worthwhile facts about space saving, low water line of 50", long life, and fuel saving.

FOREIGN EXCHANGE IN ALL ITS BRANCHES

No More Ashes To Lug

No clumsy pan to spill dust
and dirt on the kitchen floor

The Glenwood Ash Chute

solves the problem. It is located just
beneath the grate and connected by a
sheet iron pipe straight down through
the kitchen floor to ash barrel in cel-
lar. No part is in sight. Not a par-
ticle of dust can escape. Just slide
the damper once each day and drop
the ashes directly into the ash barrel.

The Dust-Tight Cover

to barrel is another entirely new
Glenwood Idea and is very ingenious.
This is only one of the splendid im-
provements of the new plain

Cabinet Glenwood

the Range without ornamentation or fancy
nickel, "The Mission Style" Glenwood. Every
essential refined and improved upon. This
Range can be had with the latest and most
improved Elevated or End Gas Range attach-
ments. It can be furnished with fire box at
either right or left of oven as ordered. Our
handsome booklet tells all about it.

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

Insurance Company of North America

PHILADELPHIA

and the

*Indemnity Insurance Company of North America
write practically every form of insurance except life*

You Can Pour Concrete In Freezing Weather When You Use "ANTI-HYDRO"

This entire building was constructed between November and February with the aid of "ANTI-HYDRO." You can continue concreting, cementing and masonry work without interruption during freezing weather when you use "ANTI-HYDRO", because it lowers the freezing point of concrete and cement mixtures to 17 degrees below the freezing point of water.

Use "ANTI-HYDRO" on your next job. During 20 years of continuous use it has never failed to live up to the claims made for it.

As The Editor Sees It

President Coolidge, in addressing delegates to the Sixth Annual Meeting of the Associated General Contractors of America, in Washington on the opening day of the convention, January 12th, emphasized the importance which a smooth functioning of the construction industry holds as a factor in the prosperity of the country. He outlined the benefits to be gained from equalization of the volume of construction throughout periods of abnormal activity and depression.

The President also indicated the vast aid to the economic structure to the country to be obtained from development and adoption of uniform contract forms. "These forms," he said "promise much as an assurance of fair treatment to all."

He said:

"There are certain particular reasons why I have been glad to avail myself of the opportunity, afforded by your presence here today, to make some remarks to the members of this association. The importance of construction among the country's industries hardly needs any testimony. A recent analysis reached the conclusion that the national income in 1924 was \$53,600,000,000, of which approximately \$6,000,000,000 was expended for construction. That is, over 11 per cent. of the income. Constructions of one kind and another largely represent the accumulated wealth of a community, and it is therefore important that they

be erected at the lowest feasible expense consistent with a high standard of permanence and usefulness.

"During the war, owing to more instant demands upon producing capacity, construction was neglected and an enormous construction deficit resulted. The necessity of restoring the balance was realized when peace returned, and we have had an era of high construction activity in recent years.

"At the Unemployment Conference called by President Harding, and held here in Washington in 1921, the importance of construction as a balance wheel in the industrial scheme was strongly emphasized. The suggestion, of course, was not new. The idea of utilizing construction, particularly of public works, as a stabilizing factor in the business and employment situation has long been a counsel of perfection among students of these problems. If in periods of great business activity the work of construction might be somewhat relaxed; and if in periods of business depression and slack employment these works might be expanded to provide occupation for workers otherwise idle, the result would be a stabilization and equalization which would moderate the alternations of employment and unemployment. This in turn would tend to favorable modification of the economic cycle. It is something to be greatly desired, but its accomplishment is attended by much difficulty. As

a practical proposition, it is not easy to convince a man whose factory is idle or running on part time, that he ought to construct an addition to it because at some future time it will be needed, nor easy to recognize good times until they are passed. Also if Government withdraws from the market others are likely to follow, nevertheless the first and easiest application of such a regulation is in connection with public works; the construction program which involves public buildings, highways, public utilities, and the like. Most forms of Government construction could be handled in conformity to such a policy, once it was definitely established. Certainly in time of depression government can start building. This applies not only to the construction activities of the Federal Government, but to those of states, counties and cities.

"More than this, the economies possible under such a plan are apparent. When everybody wants to do the same thing at the same time, it becomes unduly expensive. Every element of costs, in every direction, tends to expand. These conditions reverse themselves in times of slack employment and subnormal activity, with the result that important economies are possible.

"I am convinced that if the Government units would generally adopt such a policy, and if, having adopted it, they would give the fullest publicity to the

resultant savings, the showing would have a compelling influence upon business generally. Quasi-public concerns, such as railroads and other public utilities, and the great corporations whose requirements can be quite accurately anticipated and charted, would be impressed that their interest could be served by a like procedure.

"The tendency of present times is undoubtedly toward conservatism in turning out articles intended for current consumption. The merchandising community is chary of laying in great stocks against a future market, because of the many uncertainties that still remain as a heritage from the war period. It is true that these uncertainties are far less acute in our country than in most others; but their existence in other parts of the world inevitably has a certain effect here. On the whole, then, our search for a factor of balance and stabilization brings us back to this business of construction which is represented here today.

"It is found by those governmental agencies which maintain touch with these matters, that notable progress has been made in efforts to lessen the seasonal element in employment in the construction industries. They report that employment is better spread through the year than ever before, and that in the last two or three years the proportion of winter-time employment has been considerably increased. This is entirely to the good, although much remains to be desired in this regard.

"Organizations such as your own represent possibilities of much good usefulness in dealing with all these problems. To the extent that they are devoted to such useful ends, they are entitled to all encouragement. In the construction industries, the movements to develop uniform contract forms promise much as an assurance of fair treatment to all competitors, and securing the best work. It is always recognized, of course, that such organizations may be the means to an undesirable limitation of competition, and to the unjustifiable increase of profits.

If trade associations could be so conducted that the public might be assured of all their potential advantages, and at the same time safeguarded against the disadvantages incident to restricted competition and the exaction of too liberal profits they would render a large service to the community, and would be assured of a corresponding measure of confidence and support. A very wise man, Adam Smith, writing some century and a half ago, made an observation which suggests how uniform are the processes of human nature through the generations. He said: 'People of the same trade seldom meet together even for a merriment and diversion, but the conversation ends in a conspiracy against the public, or in some contrivance to raise prices.'

"We have had a good deal of evidence in our own time that this dictum of the wise old Scotchman is quite as applicable in one generation as in another. It is this trait of human nature which has in more recent years compelled society to adopt regulative measures to protect itself. I can assure you we can all agree that organizations of this kind will command the greater public confidence, and be the more capable of lasting usefulness, if they recognize the danger of falling into such practices. There is ample opportunity for good and useful results through organization, without overstepping the boundaries of public interest, honest competition, and fair dealing. To such a program every trade association may well be recommended. By punctilious observance of such aims and limitations, they will best serve themselves and win the commendation of the community."

T. M. Gibbs Construction Company, General Contractors, announce the removal of their offices to Corn Exchange Bank Building, 1510 Chestnut Street, Philadelphia.

The man who doesn't advertise, these days, is forgotten. The world is too busy to look up dead ones.

Contract awarded Joyce & Kerrigan, Wilmington, Del.

THE NEW VOGUE OF MILL CONSTRUCTION

*Booklet Prepared by Engineers and
Architects Explains Recent High
Development of This Type of
Industrial and Commercial
Building*

The marked increase in favor of mill construction for factories and warehouses is accounted for by the facts regarding such construction. These are summed up in the sixth chapter of the National Lumber Manufacturers' Association's notable fire prevention series,

which is a part of the cumulative work on "Lumber and Its Utilization," the technical classic on this subject.

The demand for mill construction has occasioned a widespread desire among architects, engineers, industrial executives, building officials, contractors, and others, for complete and authoritative information on the subject. Accordingly the engineers and architects of the National Lumber Manufacturers' Association have made a careful study from which results the present chapter on "Fire-Safe Industrial Buildings" and the following one on "Details of Heavy Timber Construction." The former is now ready for distribution in booklet form. It is being sent to all persons who have applied for the previous chapters of "Lumber and Its Utilization" as well as to certain professional lists. A copy will be forwarded gratis, on application, to manufacturing companies, interested professional men, and industrial executives. It is in no sense an advertising publication but is purely technical and educational.

This new chapter deals carefully with the fundamental considerations that should be taken into account when selecting the housing accommodations for industrial and manufacturing processes. It treats in a broad way of elements vital to business success;—economy of fixed investment; rapidity of building; independence, during erection, of seasonal weather conditions; slow-burning or fire-resistance quality. It takes into account the importance of protecting the contents of a building and points out how important for continuity of operations is the segregation of the stories of a building by eliminating vertical and horizontal fire travel channels. How the owner, the business executive, the architect and engineer, as well as the operative constructor, profit from the use of this type of building construction is indicated in fact-presentations.

Making a direct challenge for support in effecting a reformation within the construction industry, leading contractors engaged with officials of surety companies in a hot session as the Sixth Annual Meeting of the Associated General Contractors of America drew to a close. Speakers declared a chaotic condition exists in the industry because irresponsible contractors are given bonds. The contractors stated they will carry the matter through to the Federal Trade Commission and will seek state legislation to force the issue in the event an agreement for reform is not reached speedily by other means. Representatives of committees appointed by other elements of the construction industry were present and pledged their support to the contractors.

The officials of the surety companies sought to have a permanent commission appointed to investigate the situation. The contractors, charging the bonding organization with already having delayed direct action moved to take the situation in their own hands when they voted to turn the entire subject over to their special committee on insurance and bonds.

Speakers for both sides, representatives of the bonding companies having been invited to present their case, agreed the present situation is costing the public a large amount of money annually. The surety officials pleaded they find great difficulty in determining a means for fixing the responsibility of an individual contractor.

Several meetings between the contractors, public officials and representatives of the bonding companies have been held during the past two years.

Those who addressed the convention declared, however, that the situation has become so acute during this time that some method of ridding the industry of irresponsible contractors must soon be found if present distressing conditions are to be averted.

Geo. B. Walbridge, Detroit, Michigan, was elected President of the Association to succeed Frederick L. Cranford, Brooklyn, N. Y.; H. W. Baum, Salt Lake City, Utah, was chosen Vice President at Large; Sumner Sollit, Chicago, Godfrey Edwards, Los Angeles, were chosen Vice Presidents. The following were named as Directors: E. R. Shenk, Erie, Pennsylvania; J. S. Crinkley, Memphis, Tennessee; F. M. Garthwaite, Charlotte, N. C.; H. S. Tullock, Leavenworth, Kansas, and C. W. Lundoff, of Cleveland.

Suggestions made and policies outlined by President Coolidge, Secretary Hoover and Secretary Work in addressing the Convention were followed in the resolutions adopted by the final business session. Among them was a resolution Seasonal Fluctuation in Construction; favoring a Division of Public Works; condemning day labor; advocating apprenticeship training; for a code of contract laws; on railway legislation; separate contracts; on bonding practices; on lien laws, and a resolution expressing the thanks of the convention to all those who participated in the convention's deliberations.

Haphazard business operations that have been fastened on the government by a mass of conflicting contract laws are soon to be escaped, General H. M. Lord, Director of the Bureau of the Budget, said in addressing the sixth annual meeting of the Associated General Contractors of America, at Washington last week.

He announced that a standard contract form which will make a "contract with

the government a prize to be secured rather than a pest to be avoided" will soon be presented to President Coolidge for his approval.

That the government's present manner of contracting for work is resulting in gross waste of the public funds was indicated by General Lord when he stated the country has "paid dearly" for the chaotic conditions imposed by the 224 separate contract laws passed by Congress. Many of these laws overlap and thus befuddle the government agencies.

General Lord also announced plans for the drafting of a single contract law to replace the befuddling legislation which now governs the letting of federal contracts.

HOLLOW TILE WALLS GIVEN FIRE TEST

Hollow building tile having double shells on the two exposed sides give very good results from the point of view of fire protection, the Bureau of Standards finds. The exposed shell serves as a protection for the rest of the tile, and in order to distribute the stresses properly, the web connecting this outer shell with the inner wall of the tile should be thinner or less in number than the webs back of the inner wall.

Gypsum and Portland cement plaster coatings over hollow tile will stay in place during ordinary fire exposure and will give about the same protection from fire as the addition of one wall and cell to the thickness of the tile.

The addition of a combustible filler, such as sawdust, to the clay in amounts from 5 to 15 per cent. by volume, decreases the cracking of the burnt tile when exposed to fire, but has the disadvantage of producing a decrease in strength for the larger amounts of filler, thus lessening the ability of the tile to carry load under fire exposure.

More than 100 tests of small tile panels have been made, the panels forming one side of a special furnace. Eight tests have been made on walls 11 by 16 feet, and these are the first of a series of 50 fire tests to be conducted on hollow tile walls in the near future. Some of these walls will be tested restrained by the heavy panel frame as they would be if supported by cross walls during an actual fire. Others will be unrestrained, being supported only at the bottom. In some of the tests the walls will carry their normal working load.

Other points found to add to the quality of tile are sufficiently fine grinding of the raw material, the even burning of the clay to normal hardness for that particular clay, the provision of sufficiently heavy shells and webs, and the use of ample fillets where the webs join the shell.

"Come and See How A House Should Be Built" is the appeal to be broadcast to the public and to architects, contractors and builders at the Chicago Fifth Annual "Own Your Home" Exposition when visitors will be permitted to peep behind the scenes at the Coliseum where the Exposition will be held from March 21st to 28th.

For many years at both the Chicago and New York Expositions, the public has been charmed with the full size houses that have been erected and completely furnished through the co-operation of all exhibitors, and the various exhibit committees, particularly the Architectural and Building Materials Committees have decided to go further, and show the right way to build a home.

These Committees believe that the home seeker should be taught good construction methods, and the proper uses of certain materials, and that builders and contractors will find it to their interest to observe these methods as will be demonstrated in a novel way at the Chicago and New York Expositions. The same plan may be used at Philadelphia and Buffalo where the same management that has so successfully conducted the New York and Chicago Expositions will hold similar Expositions for the first time this Spring.

Accordingly, (for the above reasons and also because each year something new must be devised to attract the Exposition visitors,) there will be erected in the center of the floor, a vine covered facade, with an English rose garden, a portion of the roof and several windows to demonstrate the various modern types of windows and frames. This front elevation will be complete in every way and give the appearance of a finished house, and the rest of this structure will be shown under the process of construction, presenting striking lessons in how a foundation should be laid, walls built, and plumbing installed. Partly constructed walls, cross section displays, exposed plumbing fixture connections, a strip of flooring adjoining one of the partly constructed walls (showing how floors should be built,) various types of insulating material exposed in side walls and other products will be on view.

Such a display will provide visitors with a comprehensive picture of correct construction, educate them in the use of standard materials and products and finally convince them that the properly built house will have considerably less upkeep than one that is poorly built. In this connection, the New York Exposition Concrete House and Cement Products Committee of which B. N. Wait, District Engineer of the Portland Cement Association is Chairman, states that this Committee intends to advise visitors to the New York Exposition that: "When a man buys a house he can only get one of

two things in the last analysis—a well built house or a poorly built house. A house that is generally well built but has only poor plumbing or perhaps poor floor construction or a poor heating plant is to be considered a poor house even though all the other items in the house are good because it inevitably makes for trouble and expense. If the house is well planned and soundly built the repairs for the first ten years will be practically negligible and limited to replacement of minor parts subjected to wear such as faucet washers, repainting of parts exposed to weather, etc. The depreciation also will be very small.

"A first cost that may be lower by \$200 or \$300 in a \$6000 or \$7000 house is usually the utmost that the owner can get by accepting inferior materials. Acceptance of a cheap paint, for example, in place of a high grade paint will mean, in the neighborhood of the city, repainting every two years at a cost of from \$200 to \$300 which alone would offset the so-called saving mentioned above. Defective lumber will shrink and warp causing the house to settle, resulting in cracked plaster and torn wallpaper—another item of expense for immediate repairs. In such cases the cracking will be so extensive that repairs will be necessary inside of six months from the date of purchase. The substitution of cheap plumbing, iron pipe for brass, etc., may result in burst pipes, ruined ceilings, the cost of repairing which will run into hundreds of dollars.

"The average man says 'Depreciation is a bookkeeper's item and I don't have to make any provision for it. It is not something in dollars and cents that I have to pay out every year.' Above have been given a few of the dollars and cents items that he does have to pay out every year. If, because of a change in his work, sickness or death in his family, change in the character of the neighborhood or one of a dozen other reasons, he has to move and wishes to sell his house he will find that this item of depreciation is very decidedly a dollars and cents matter; that a house that is run down at the heels with a leaking roof, bath tub and wash basins stained with rust from the iron pipe plumbing, cracked ceilings, sagged floors, creaky stairs, etc., will not bring him within \$500 to \$1000 of what he hopes to get out of the house."

It will be pointed out to the general public at the Exposition in each city that these lessons apply not only to the man who is building his own home but to the man who is preparing to buy a home already built so he may be equipped to look for the places where an unscrupulous contractor would be likely to substitute inferior and short lived materials for those that can give good normal service.

This new method of selling the visiting architects, builders and contractors the merits of certain materials, and in appealing to the attending public to INSIST that their architects, builders and contractors specify certain materials, will, in the opinion of prominent members of the construction and allied trades do much to encourage the sale of the materials and products exhibited on the Exposition floor, and such displays are in accordance with the preparation of a Code of Ethics by the Exposition Management with the co-operation of the exhibit committees. The Code, to be used in the conduct and further development of the Chicago, New York, Philadelphia and Buffalo Expositions, covers the various divisions at the Expositions, sets forth the standards to be maintained in visualizing the different professions and trades, and the points to be emphasized to the public, the kind of exhibits acceptable to the management and the exhibit committees, and is designed to raise the standard of homes built in the future.

The final draft of this Code is not yet finished and is being edited by representatives of the forty national allied trade organizations and associations that a year ago approved the plan of licensing such expositions and shows as agreed to certain rigid rules of conduct as laid by the National Association of Real Estate Boards. (The New York and Chicago Expositions were awarded License Numbers One and Two under this national plan of central control, and this year the Philadelphia and Buffalo Expositions were awarded Licenses Numbers Three and Four).

So, as the Chapter of the Code of Ethics on Building and Contracting stands at present, the Exposition management stands for honest construction, realizes the possibilities of the substitution of shoddy for good materials, but that poor workmanship and poor materials or both, will weaken the house and reduce its useful life to a very few years.

The dates of the four licensed "Own Your Home" Expositions have been coordinated so national manufacturers may prepare one exhibit for travel from city to city. The New York Seventh Annual Exposition will be held in the 69th Regiment Armory from April 18th to 25th; the Philadelphia First Annual Exposition will be held in the Commercial Museum from May 9th to 16th, and the Buffalo First Annual Exposition will be held in the Broadway Auditorium, May 30th to June 6th. All of the Expositions are under the auspices of the local real estate boards in addition to being licensed by the National Association of Real Estate Boards, though no more space is allotted to real estate than to any other division.

The American Society of Civil Engineers has appointed or approved the appointment of the Chairmen of the Building Materials Committees in each city (being one of the forty national organizations approving the conduct of such expositions under the licensing plan.)

Gardner C. Coughlen, Secretary, American Specification Institute, is Chairman of the Chicago Exposition Building Materials Committee which includes: F. W. Benedict, Devoe & Reynolds Co., Inc.; W. D. Claffey, Oak Flooring Bureau; Wharton Clay, Commissioner, Associated Metal Lath Mfgs.; Charles F. Dynes, Wisconsin Lime and Cement Co.; A. J. Eggleston, Richards-Wilcox Mfg. Co.; E. H. Ervin, H. H. Birge & Sons Company; C. G. Henning, U. S. Gypsum Co.; C. H. Howae, National Kellastone Co.; Geo. N. Lamb, Secretary, American Walnut Manufacturers Assn.; Thomas Lehon, President, the Lehon Company; John Lind, Prepared Roofing Association; C. A. Livingston, Illinois Manufacturers' Association; P. M. Louwerse, Truscon Steel Co.; H. N. McDonald, Gypsum Industries Association; F. J. McManus, Barber Asphalt Co.; Walter N. Moore, E. B. Moore, E. B. Moore & Co.; Thomas Moulding, Thomas Moulding Brick Co.; T. B. Munroe, The Celotex Company; L. N. Nelson, Illinois Zinc Co.; J. S. Sleeper, Hollow Building Tile Association; W. L. VanDame, W. L. VanDame Co.; and H. S. Williams, David Luptons Sons Co.

Col. Roger D. Black is Chairman of the New York Exposition Building Materials Committee, and Emile G. Perrot is Chairman of the Philadelphia Building Materials Committee. T. W. Bannally, City Engineer of Tonawanda, member Engineering Society Buffalo, is Chairman of the Buffalo Exposition Building Materials Committee. The memberships of the New York, Philadelphia and Buffalo Committees will be announced at a later date.

NATION'S BUILDING SHORTAGE

A nation-wide survey, covering all cities having a population of 10,000 and over, has just been completed by S. W. Strauss & Company to determine the present building shortage. The report based on the results of this investigation shows that there is a shortage amounting to more than \$4,000,000,000. Of this amount \$2,102,698,500 is needed for residential buildings; \$1,130,851,500 for commercial buildings; and \$870,270,000 for public buildings of all kinds. The survey covered 528 cities of which number 148 showed no shortages. Several cities having a population under 10,000 were also studied, many of which revealed a shortage in all types of buildings.

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

As The Editor Sees It

Resolutions passed by the Sixth Annual Meeting of the Associated General Contractors of America held in Washington January 12, 13 and 14:

Resolution No. 1 on a Federal Code of Contract Law

Whereas, the Federal laws pertaining to public contracts, some of which are more or less in conflict or were enacted to meet a condition which is no longer present; and

Whereas, the changing industrial system and the relationships between the Government and the commercial world have created new situations with which the laws pertaining to public contracts should be harmonized; and

Whereas, revision and codification of these laws would result in clearer understanding by the commercial world of its obligations with the Government in contracting matters, some of which necessarily vary from commercial practice; and

Whereas, the Interdepartmental Board of Contracts and Adjustments of the United States is completing a proposed code of public contract law;

THEREFORE BE IT RESOLVED, That the Associated General Contractors of America endorse the objects of the Interdepartmental Board and that this code of laws should be enacted without exercise of partisan politics and that it should receive the support of the entire commercial world.

Resolution No. 2 on Railway Legislation

Whereas, The railroads of the country have demonstrated their ability under the terms of existing law during the past two years to handle, with practically complete satisfaction to the shipping public, the traffic that has been offered to them in unprecedented volume without car-shortage congestion, or other transportation disabilities; and

Whereas, The railroads have declared their determination to continue their policy of expansion to provide adequate transportation for the increasing commerce of the country and to strive for greater efficiency in operation and a progressive reduction in cost.

THEREFORE, BE IT RESOLVED, By the Associated General Contractors of America that they urge upon members of Congress and the people of the country that all railroad problems as they arise be dealt with and settled as economic questions and not as political issues; and

That there is no condition existing to-day which calls for any urgent legislative action by the federal Congress with respect to the railroads, either as to rates, labor relationship or valuation; and

That adjustments in railroad freight rates and passenger fares should be left to the duly constituted government regulating bodies, where they will receive a full and fair hearing and an adequate economic analysis, and not be made the

subject of direct legislative action; and

That a continuation of adequate transportation facilities and service necessitates adequate revenues in order that railroad credit may be restored and re-established in the confidence of investors and that ample additions, improvements and repairs may be made at reasonable financial costs.

Resolution No. 3 on a Federal Department of Public Works

Whereas, the construction activities of the United States Government have increased in extent and diversity until such activities including engineering, maintenance, operation and administration have become a major function of the Government and therefore exert a direct influence over national progress and well-being; and

Whereas, the construction functions are distributed among many bureaus under divided authority and without co-ordination of effort, purpose and control essential to economy and efficient accomplishment; and

Whereas, it is obvious that the future growth of Federal Public Works must largely exceed past growth;

THEREFORE BE IT RESOLVED, That the Associated General Contractors of America urge that the present system of Federal construction, including engineering and administration, be co-ordinated into a single division to be known

PRINTS**

as the Division of Public Works in the Department of the Interior, the head of which shall be suitably qualified to administer the Division efficiently; and

BE IT FURTHER RESOLVED, That the Associated General Contractors of America use all legitimate and proper means to bring about the creation of this Division of Public Works in substantial accord with the recommendations submitted to Congress and commonly known as the Brown Plan, outlined on Chart B, organization of the Executive Departments, Documents No. 356, 68th Congress, first session.

Resolution No. 4 on Day Labor Construction

Whereas, it is a fundamental principle of American government that Federal, State and Municipal governments and political subdivisions thereof, should not enter into competition with private industry, where that industry is capable of efficiently serving the public need; and

Whereas, it has been clearly demonstrated that private industry with individual initiative and ability can carry on production more economically than a public agency; and

Whereas, the successful and economic performance of construction projects depends upon executive ability and special knowledge of construction methods obtainable only through actual experience; and

Whereas, numerous investigations have proven that the performance of public construction by the day labor forces of governmental bodies has resulted in a waste of public funds; and

Whereas, numerous Federal, State, County, Municipal and other governmental construction departments are performing each year millions of dollars worth of construction by this unsound day labor method.

THEREFORE BE IT RESOLVED,

First—That the practice of performing public construction work by the day labor method where a definite program with

complete plans can be prepared in advance is unsound, wasteful and opposed to the best interests of the public.

Second—That legislation should be introduced into Congress and the state legislatures requiring:

(a) The preparation of complete plans, specifications and estimates before any peace-time construction project is begun with full publicity of same and of any changes subsequently made

(b) A full and correct accounting of the cost of the work

(c) Provision for publication of the actual and estimated cost, which shall be open for public inspection.

Resolution No. 5 on Apprenticeship

Whereas, it is necessary to provide an adequate supply of trained and skilled mechanics to meet the growing needs of industry, especially in the various building trades; and

Whereas, the most effective and practical method of meeting the ever increasing necessity for a greater number of better trained craftsmen which will raise the standard of skill, efficiency and citizenship of the mechanic, is through an adequate apprenticeship system; and

Whereas, an efficient method of apprenticeship training in the construction industry, based upon uniform standards throughout the nation is a public need;

THEREFORE BE IT RESOLVED,

That the Associated General Contractors of America in convention assembled approves and endorses the report of its Committee on Labor and a national system of training for building trades craftsmen; and

BE IT FURTHER RESOLVED,

That the Associated General Contractors of America approve the work of the Federal Board of Vocational Education in co-operation with other agencies to meet the existing need for adequate apprenticeship training; and

BE IT FURTHER RESOLVED,

That the Associated General Contractors

McKeever, Heating Con-
tractor, 247 W. 13th St.,
N. Y. C.*

*50 inch
Water Line*

Past Experience Selected the Boiler for this Factory

The Propper Silk Hosiery Mill is situated in an exposed position with all four walls principally of glass. It presented a real heating problem.

However, the Heating Engineer had had ample opportunity to know what the Novelty Carburetor Boiler will do. His experience with 2 No. 10-40 and 1 No. 9-40 Novelty Carburetor Boilers in the new Park Avenue Baptist Church (the "Rockefeller" Church), together with his knowledge of what 3 No. 13-40 Novelty Carburetor Boilers had accomplished for him in the Title Guarantee & Trust Company, Jamaica, Long Island, was his assurance that all heating requirements would be adequately met by again specifying a

A side-feed, sectional boiler, the Novelty is admirably adapted to large buildings. The Carburetor Chambers (one to each section) on the rear of the boiler, automatically mix all smoke, soot and carbon with oxygen from the air and burn them. The air enters top and bottom slots in the rear of each carburetor, as shown in the picture. No adjustment of air intake is necessary. Rate of combustion determines amount of air required.

Write for illustrated and descriptive booklet giving worth-while facts about space-saving, low water line of 50", long life and fuel saving.

(Continued from page 52)

tors of America pledges its support to the public program of vocational education, to the end that there may be such cooperation locally and nationally as will insure the success of apprenticeship training.

Resolution No. 6 on Seasonal Fluctuation in Construction

Whereas, extreme seasonal fluctuation of construction, resulting primarily from long established habits rather than from any actual necessity, prevents continuous employment during the winter, increases the cost of construction and results in unnecessary waste; and

Whereas, an investigation of seasonal fluctuation in the construction industry, conducted by the Department of Commerce, has indicated the advantage of lengthening the active season of operation and of performing various types of work during the winter;

THEREFORE BE IT RESOLVED,

That the Associated General Contractors co-operate further with the Department of Commerce and commercial organizations to eliminate seasonal habits in construction, and encourage more continuous operation throughout the year.

Resolution No. 7 on Separate Contracts

Whereas, various agencies and organizations have attempted to create an impression that the general contractor is not an essential element of the construction industry and have sought to establish the system of awarding separate contracts for various portions of the work; and

Whereas, the centralization of responsibility in a single agency and the efficiency of the general contract system are clearly demonstrated by centuries of experience; and

Whereas, the Interdepartmental Board of Contracts and Adjustments after full investigation of the two systems has rendered an official decision rejecting the separate contract system;

THEREFORE BE IT RESOLVED,

That the Associated General Contractors vigorously oppose the use of separate contracts and the enactment of any legislation to establish the use of such contracts by law.

Resolution No. 8 on Bonding Practices

Whereas, an investigation of surety bonding practices conducted by the Joint Conference on Surety Bonds, a conference representing highway officials, surety agents, surety officials, equipment manufacturers, and the Associated General Contractors of America, has disclosed that many incompetent, irresponsible and dishonest persons can obtain a

surety bond on construction work, this fact being publicly acknowledged by responsible surety officials before the Joint Conference; and

Whereas, this practice of bonding irresponsible bidders on public construction has been attended by defaults aggregating millions of dollars each year, and by an enormous increase of premiums directly proceeding from the assumption of improper risks and failure to work out a sound system of investigation; and

Whereas, many of the surety company agents who receive commissions incommensurate with any necessary service performed have connived with irresponsible and dishonest bidders in deceiving the bonding companies with respect to the bidder's capabilities; and

Whereas, the magnitude of commissions received by these agents has enabled many of them to rebate with contractors or with owners and public officials, thus forcing bidders to place their bonds with specific agencies; and

Whereas, legislation has been passed in numerous states giving a complete monopoly to the corporate surety bond; and notwithstanding there are other forms of surety adequately protecting the public against loss from failure by contractors; and

Whereas, the Associated General Contractors of America, representing both large and small contractors, are annually executing approximately two billion dollars worth of construction and for that reason have a vital interest in the conduct of contract bond underwriting; and

Whereas, conditions cited to the Joint Conference by prominent engineers and others indicate clearly that the underwriters have failed to define responsibility or to establish proper underwriting standards, thereby resulting in the creation of unwarranted credit; and

Whereas, constructive measures proposed by the Joint Conference on Surety Bonds for correction of these matters have been submitted to the Surety Association of America for consideration and action; but have received no action other than the passage of resolutions of obscure meaning which offer no promise of correcting improper underwriting methods which they themselves admit exist, and which result in the exploitation of the construction industry, rather than in serving the public.

THEREFORE BE IT RESOLVED, by the Associated General Contractors of America in Convention assembled:

First—That contractors in every state introduce into their respective legislatures a bill to prohibit public officials from acting as agents for surety companies, or from attempting to influence the placing of these bonds with any specific surety.

Second—That legislation permitting optional use of other forms of surety be

introduced into every state to break monopoly which has already been created for the corporate surety bond.

Third—This Association will welcome a complete investigation of rebating by agents to contractors, public officials, owners and their representatives.

Fourth—That the measures herein proposed be prosecuted with the utmost energy of this Association, to the end that the entire group of surety officials be brought into effective co-operation with the leaders in their business who are willing to eliminate existing practices inimical to both public and private interests, and that this Association continue to co-operate with any responsible groups interested in eliminating these practices.

Resolution No. 9 on Lien Laws

Whereas, the original intent of the lien law was for the protection of the laborer and mechanic; and

Whereas, the material and supply firms use the lien law as a basis for establishing credit; and

Whereas, the unsuspecting owners commonly find themselves compelled by law to pay twice for material; and

Whereas, the construction industry is materially and detrimentally affected by the irresponsible being furnished material under the protection of the lien law;

THEREFORE BE IT RESOLVED, That this Association go on record as opposed to the enactment of any lien law which may be used as an extension of credit to the purchaser of materials

BE IT FURTHER RESOLVED, That the Associated General Contractors, through its various publications and otherwise, oppose the practice of sales being made under the protection of lien laws in such states as the lien law now exists.

A three days' Terra Cotta Institute will be held at the Carnegie Institute of Pittsburgh in Pittsburgh in co-operation with the National Terra Cotta Society on March 17, 18, and 19, according to an announcement. The meeting, which is announced as the first of its kind arranged in this country, is being planned for the benefit of architects and the building, terra cotta, and ceramic industries.

With the exception of a registration fee of One Dollar, no tuition fees or other charges will be made to those who attend the institute. It is expected, it is announced, that the three days' affair will appeal particularly to persons connected with the related industries in Western Pennsylvania although any one who is interested will be welcomed.

The three days' institute will be conducted under the jurisdiction of the Department of Industrial Relations at Carnegie Tech with Dr. C. B. Connelley, Director of the Department, in charge.

A committee representing the several professions and industries interested in the meeting, is co-operating with Dr. Connelley in arranging a program.

Among the lecturers already engaged for the sessions are: F. S. Laurence, Executive Secretary, of the National Terra Cotta Society, on "Terra Cotta in Architectural Design;" Adolph Hottinger, Treasurer, The Northwestern Terra Cotta Company, Chicago, on a technical subject in ceramic sciences; Cicil Fidler, of the Atlantic Terra Company, Perth Amboy, N. J., upon requirements of construction in terra cotta; A. H. Sheffield, Terra Cotta service Bureau, Chicago, upon a general subject of terra cotta.

All of the meetings of the institute will be held in the College of Fine Arts.

ALL-YEAR-ROUND BUILDING

In the opinion of Gustave Kahn, vice-president and general sales manager of the Truscon Steel Company, building construction is now an all-year-round business. Mr. Kahn says in part: "The idea of crowding a year's construction work into three or four hectic months is a relic of the days when concrete could not be poured after the thermometer dropped below the freezing point and it was believed unsafe to lay brick during cold weather. Due to modern construction facilities, any kind of building from a dwelling to a skyscraper can now be put up no matter what the weather may be and without any delay. The long periods of inactivity have been done away with to a considerable extent, but the 'interludes' are still with us. Lengthening the building season will mean greater production from men now engaged in the building trades and will go far toward attracting capable apprentices."

IMPORTANCE OF CONSTRUCTION INDUSTRY

"More than 11,000,000 of our people are dependent for their living upon the construction industry, and 22 per cent of all the skilled and unskilled labor of the country is engaged in the building branch alone." Secretary of Labor, Davis, said recently, "Some 250,000 freight cars are required to handle the materials. Our building bill is \$200 per year for each family in the United States. It is truly the chief barometer of the business of the country. When construction gains, prosperity is with us. It is the great outstanding influence for good or bad in our financial progress."

If your sales-talk is keyed to interest men who build it should occupy space every week in the "Guide," the only building news magazine this side of Manhattan Island.

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

"ANTI-HYDRO" Lowers the Freezing Point of Concrete to 15° F.

You don't have to stop your Concrete and masonry work during freezing weather if you use "ANTI-HYDRO." All the brick work in this building was laid during freezing weather; results were entirely satisfactory.

"ANTI-HYDRO" is a liquid integral compound which also makes concrete permanently hard and waterproof all in one operation. It is easy and economical to use—simply mix it with the gauging water—no skilled labor required.

During the 20 years that "ANTI-HYDRO" has been in use, it has never failed to produce satisfactory results. Use it on your next job.

As The Editor Sees It

1925—ANOTHER FIVE BILLION DOLLAR BUILDING YEAR

*Annual Building Survey and Forecast by
"The Architectural Forum"*

Copyrighted Jan. 1925

Perhaps the most interesting statistical development in the building field during the past few years has been the Annual Building Survey and Forecast by the Architectural Forum. For the past three years, since the institution of this annual forecast, the Forum prediction as made the first of each year, has been within 3 per cent. correct when compared with actual figures at the end of the year. This forecast of building activity is based on a comprehensive survey carried out through individual reports from building contractors, bankers and from building contractors, banker and others directly interested in the construction field. The investigation is made in 19 building types and covers each state. Percentage comparisons are made with the previous year in each classification, so that there is provided not only a definite measure of activity in each district, but a relative measure of the increase or decrease of public interest in the particular building type in question.

The accompanying tabulation represents in detail the Fourth Annual Survey and Forecast of The Architectural Forum, which indicates for 1925 another \$5,000,000,000 building year, the actual

figure determined by the survey being \$4,992,318,000.

This Survey was conducted in exactly the same manner as that used successfully for the past three years during which period the Forecast of the Architectural Forum presented at the first of each year, has closely approximated the actual totals of the year. In January 1924, the published forecast of The Architectural Forum predicted an expenditure of \$5,560,367,700 during that year. Figures now available prove that this prediction was correct within 3 per cent. A recent statement by S. W. Straus & Co. is as follows:

"The year 1924 has been the largest building year in the history of the country in point of financial requirements. Last year the volume was \$5,500,000,000, but aggregate operations this year exceed the 1923 total by about 4½ per cent."

Factors Influencing 1925 Building

All evidence would seem to bear out this prediction that 1925 is to be another record building year and that the great momentum of the building industry would continue almost unchecked. The basic elements which establish the total volume of building in any given year include the following:

An established shortage of buildings.
Public confidence in the building situation.

Stabilized costs.

Good transportation conditions.

Ample mortgage money.

Good labor conditions.

Well maintained rentals.

Sound general business conditions.

In regard to the existing building shortage, a survey recently conducted by S. W. Straus & Co. states as follows:

"The year 1924 closes with a building shortage of considerable magnitude confronting the industry. In the cities of more than 10,000 population alone, this shortage is in excess of \$4,000,000,000 with a very large apparent shortage in places of less than 10,000 population."

Of course, in certain districts the building shortage has to a considerable extent been met but at present building costs, the normal expenditure required in this country is approximately three and a half billion dollars, so that even at the five billion dollar rate, it will still take several years of more than normal activity to meet the requirements of the shortage which accumulated over the period from 1913 to 1920.

There has occurred no abrupt rise in building costs or no trouble in the labor situation to disturb public confidence in building. In fact, conditions today are better than they were a year ago, for we have behind us a year remarkably free from labor disturbances and one in which building projects proceeded in a smoother manner than for many years before. Investments in mortgage bonds and individual financing of building pro-

KEYSTONE PHONE, RACE 3519

**BLUE
PRINTS**

jects continue unabated and there are no apparent signs to indicate anything but a strong element of confidence in the real estate market and throughout the building industry. In certain districts speculative building has been overdone and it may well be that the volume represented by that field will be less in 1925 than in 1924, but on the other hand institutional and commercial building promises to over-balance this situation.

Building costs have remained fairly stable during 1924 and with the exception of some seasonal fluctuation it is anticipated that costs will remain well stabilized during 1925.

The handling and shipping of building materials has been greatly facilitated by improved transportation conditions, and this fact coupled with the good production situation, makes it possible to obtain deliveries without undue delays so that the element of waste has been considerably eliminated from the building cost situation. Building material manufacturers are producing and distributing their products today more extensively and more smoothly than ever before in the history of the industry. In spite of the huge building program of the last year, there are no apparent shortages of materials. This is a particularly important fact because the shortage of materials in the past, particularly prior to 1924, has been a definite drag on the developing momentum of the construction industry.

Building finance is in excellent condition, primarily due to the confidence of the public in this field and to the ability of building enterprisers to pay well for the use of money. Reports from mortgage companies everywhere indicate confidence in the situation and willingness to aid in any legitimate building project. The amount of money directed into building channels through mortgage bond companies is increasing every year and mortgage bonds have become a standard form of investment in every section of the United States. Secondly, financing has also become easier and with fairly well stabilized building costs, it is probable

that building operations can be carried out with an even smaller proportion of equity than at any time during the past few years. Real estate circles report considerable activity in the sale of sites for buildings of all types, including a considerable movement in suburban districts.

The labor situation in the building field promises little or no trouble next year. In the various trades the union scales have evidently been worked out in a manner reasonably satisfactory to all parties and many agreements between labor and employers will probably remain in force at least during the year 1925. As no great disturbance is anticipated in this quarter, this condition becomes an important factor tending toward continued prosperity in the construction industry.

It may also be noted that rentals are evidently being well maintained on present levels and consequently building projects offer excellent investments with a strong speculative factor still in evidence. No great change is anticipated in this condition during 1925, as the demand for various classes of building occupancy is still strong except for certain districts and building types where past shortage has been overcome and even here there has been no great reduction in rental income.

Seaking of general business conditions and of the building situation. Secretary Hoover in a recent statement on the economic prospects for the year 1925, says in part:

"The construction work of the country has maintained high activity. While the shortage, particularly of housing and business buildings, due to the cessation of construction during the year, has been to a large degree overcome, yet continued high real wages and general prosperity create a demand in excess of that due only to increasing population, because of the insistence of a population of rising standards of living, for more elbow room and better housing generally. One striking factor in maintenance of increased construction activities is the ef-

Home (add.), S. E. Cor. Thirty-fifth and Market streets, Wilmington, Del., \$5,496. Architect, private plans. Owners, Layton Old Folks Home, on premises. Hollow tile, two stories, 16x39 feet, slag roof, pine floors, electric lighting. Contract awarded to Smyth Const. Co., Delaware Trust Building, Wilmington, Del.

(Continued from Page 68)

fect which the automobile is producing in increasing the demand for road construction and in causing migration of population in many of our towns to new housing in the suburbs. Another effect of these forces is to maintain rents out of line above the general price levels. With our high real wages and little unemployment, there is no reason to expect any material change in the course of this industry.

"The annual survey of the Department of Commerce shows that the New Year begins with the economic structure of the world upon more solid foundations than at any time since the war. With the exception of a few spots of secondary importance, there has been during the past year a real advance toward social, economic, and political stability throughout the world. The only exceptions are Russia and China, which even before the war contributed less than 3½ per cent. of international commerce and of course a part of this continues. Generally the world is producing more good, there is fuller employment, there are higher standards of living, more assurance of economic stability for the future and more promise of peace than we have seen for many years. The world is by no means free from liability to economic shock, yet the forces today in motion all tend to great promise for the forthcoming year.

"Savings continue at a very high rate as indicated by the increasing savings deposits, the large absorption of bond issues, and the extraordinary expansion in insurance, thus demonstrating that there has been maintained a high state of efficiency throughout industry and commerce, with little evidence of waste, extravagance and speculation. In fact, the most far-reaching movement in our economic life today is the larger understanding of its broad problems, the better appreciation of the factors of stability, and the definite progress in the elimination of waste through more stable employment, through better administrative methods and through the rapid march of scientific discovery. That we are able to main-

tain wages at 100 per cent. above the pre-war while the cost of living is 72 per cent., and the average wholesale price of commodities about 50 per cent. above pre-war, is the very definite proof of increasing efficiency in production and distribution and of the free flow of competitive action."

Comparative Activity in 19 Types of Building

With this article will be found an interesting comparative tabulation of the relative demands for different types of buildings in various sections of the country. These are expressed in percentages of the total demand and in order that comparisons may be made easily, the percentages from the 1924 Forecast are given beside the percentages for 1925.

An examination of these percentages of demand, comparing prospects for 1925 with those of the past year, indicates some interesting comparisons in various building types. The national percentages given in the right hand column indicate the variation of public interest in the various new building types. Of the total volume of new construction in 1925, the various building types evidently will show the following change in ratio of public interest as compared with 1924:

Type of Building—Comparative Activity

- Banks—slightly less.
- Apartments—slightly greater.
- Apartment Hotels—about 20 per cent. less.
- Clubs and Fraternal—slightly greater.
- Community and Memorial—slightly less.
- Churches—considerably greater.
- Small Dwellings—slightly greater.
- Medium Sized Dwellings—the same.
- Large Dwellings—slightly less.
- Hotels—about 25 per cent. less.
- Hospitals—slightly less.
- Industrial Buildings—slightly greater.
- Office Buildings—slightly greater.
- Public buildings—about 20 per cent. greater.
- School Buildings—the same.
- Retail Stores—about 25 per cent. greater.
- Theaters—slightly less.
- Welfare Buildings—slightly greater.

It is to be understood that the above tabulation shows relative public interest—not the volume of money to be spent in 1925.

Examining the tabulation further, some interesting comparisons of activity are to be found in the various districts of the country. Those which seem to represent the greatest changes in public interest, are, for instance, office building in the Northeastern States, the figures for which indicate almost double the activity

Percentage of Public Demand for New Buildings—A Comparison Between the Years 1924 and 1925

The figures shown below are percentages indicated for various building types and geographical localities. The percentages are those from the Architectural Forum Building Forecast for 1924 and for 1925. Each indicates the relative proportion of the total amount of prospective building represented by the specific building type. Percentages for the two years are presented together in each division so that the variation of interest in each type and district may be clearly shown.

Comparative Activity in Various Building Types During 1925

To demonstrate the use of this table we may take for instance the situation of bank building in the Northeastern States for 1925 as compared to 1924. In the chart the figures show that bank building in the forecast for 1924 in the Northeastern States represented 6.9% of total prospective building for that district. In 1925 bank building represents only 1.6% of the total forecast for the district. This comparison indicates that there will be much less bank building in the Northeastern States during 1925 than in 1924. On the other hand the office building situation in this district evidences twice as much activity in 1925. Similarly comparisons may be made for the 19 building types in 6 geographical divisions of the country.

Type of Building	Northeastern States		North Atlantic States		Southeastern States		Southwestern States		Middle States		Western States		United States	
	1924 %	1925 %	1924 %	1925 %	1924 %	1925 %	1924 %	1925 %	1924 %	1925 %	1924 %	1925 %	1924 %	1925 %

© THE ARCHITECTURAL FORUM

of last year while in the same district the building of retail stores promises to be almost double. Drastic changes in the North Atlantic States are to be found in industrial building which promises to be considerably less in 1925 and in office building which indicates a considerably greater activity. In the Southeastern States most building types are comparatively the same except Churches, where greater activity is promised and in the small dwelling field, which evidently is to be more active. The interest in hotel building in both Southeastern and Southwestern States has evidently diminished considerably. While in the Southeastern States school building is evidently to be less, it will be considerably greater in the Southwestern States. On the other hand, in the Southeastern States there will be more residential building than last year but considerably less activity in this field in the Southwestern States. The Middle States seem to show a considerable decrease of interest in the building of apartment hotels, while apartment building construction will be more active. Greater activity is promised in the residential field in all classes in the Middle States and a considerable increase in factory building is shown. Office building activity will be about one-third less than in 1924 in the Middle States. In the Western States apartment building evidently will fall off considerably as will hotel building, but there will be more activity in the construction of hospitals, club and fraternal buildings and factory buildings. Office building construction in the Western States will be somewhat

less but a great interest in the volume of new public buildings is anticipated. Other comparisons in these various classifications may be made for each of the six districts shown in this tabulation. While these percentages cannot be applied with specific accuracy, they do nevertheless represent a clear picture of the trends in each district.

THE ARCHITECT AND THE BUILDER

The Architect is the Medium of Exchange between the man who wants a building and the man who builds.

First of all, he must show the one, the kind and class of building desired, and the other a complete survey of what he is to build.

Changes from the original design will very often be made as the work proceeds—sometimes certain features must be added that were overlooked at the time the plans were drawn. This is to be expected as the Architect is human and the ultimate owner wishes to pay for all he gets (or he should), and the builder wishes to give for all he receives (or he should), and the Architect should see that they are both accommodated.

The Architect does not always take the stand of impartial arbitrator as he should, but, on the other hand, very often acts to the extent of arbitrary agent for the owner only.

In the view of common justice this is not the correct position! Justice in dealings between men should at all times be dealt out in full measure both ways, no

more and no less, and in this instance the Architect is the dealer.

I have often appealed to the sense of justice on the part of the Architect as to what should or should not be done under the terms of the contract and in all fairness I must say that he has rarely if ever, ignored this plea when properly presented and he realized that the builder wished to give full measure for the same amount received.

Incidentally, the contract should be an impartial document with due respect to equal rights of both parties and so written that any man of average intelligence will understand its terms, and further, that there be no discrepancies between it and the plans and specifications. It is not only best, but the height of discretion, to give all necessary attention to this feature of the project, before proceeding any further in the premises.—*Associated Building Contractor of Illinois.*

ENGLAND TO SPEND \$5,816,800,000 FOR HOUSING

Thousands of British house hunters who have been looking in vain for permanent lodgings since the end of the World War, now have a new hope of findings homes within the next fifteen years at least, if the Labor Government's scheme to erect houses costing \$5,816,000,000 is carried out.

It is intended to erect 90,000 houses in 1925, increasing to 225,000 annually during the period from 1934 to 1939 and the cost thereof to be distributed over a term of forty years.

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

As The Editor Sees It

SUMMARY OF SPEECH OF W. A. GATELY BEFORE RETAIL LUMBER DEALERS' ASSOCIATION

Where chaos has been allowed to continue indefinitely in manufacture or distribution of common commodities, there has arisen a tendency on the part of the public to call for legislation, W. A. Gately of the Division of Simplified Practice, Department of Commerce, told the retail lumber dealers' recent meeting.

One such tendency which was allowed to go through to the point of legislative restriction in one of the wood-using industries, he said, was found in the case of fruit and vegetable baskets. In this instance Congressional action fixed the standards.

The lumber industry, he continued, faced with similar possibilities arising from chaotic conditions which were partly due to heritage, to varying demands and other causes, has by the adoption of American Lumber Standards, gone a long way to forestall any such action. It has meant a lot, he said, to have standards developed in general conferences of manufacturers, distributors and representatives of consumers, for such needs have been apparent for years and have been the subject of exhaustive study.

But the real test of the value of any standards, he warned, lies in the extent of their application, and in this field there is a special duty which comes before the

retailer. Furnishing as he does the immediate contact with the consuming public, Mr. Gately continued, the retailer has a first-hand opportunity to help "sell" the standards to the consumer. He has the further opportunity of enlisting the aid of architects, constructors, and engineers in convincing the public that the lumber standards represent the best thought available in the whole industry, said the speaker. And he has a field peculiarly his own of ability to observe the standards in their working, to discover and to collect data as to any flaws in the standards as now developed.

Standards in any industry, Mr. Gately pointed out, are not final. They represent the best practices which evolution in the industry can offer to its correlated groups. They are susceptible to change, but to achieve their fullest value, such changes should be made only after the most exhaustive sort of test over a given period of time.

The full application of American Lumber Standards, Mr. Gately continued, means the elimination of the continued shrinking of sizes; the conservation of timber; the advancement of the industry in the public eye through its establishment on a more business-like plane. To stop the thinning of lumber was the first step, as if the practice had been continued the demand for restrictive—and highly expensive legislation would surely have been forthcoming. Subsequent actions were all aimed at an

upward movement for the improvement of service rendered. And as a part of this program, the progressive manufacturers or retailers must act in unison to check certain practices on the part of unscrupulous persons which have made the public look with doubt on the industry as a whole.

It is a lamentable fact, declared Mr. Gately, that little effort has been made by the industry to give the public the fullest sort of information. The industry knows that as various sections of timber area were cut off, the quality of timber found in other places, in some cases has not been of as high grade. The industry knows too that transportation costs have been a big factor in the final price to the public, particularly when valuable timber tracts have been off the common transportation routes. He deplored too the fact that the truth as to the real profits of the industry from manufacturing and distribution had never been brought home to the public in a manner to indicate the hazardous and vexing problems which the entire lumber industry faces.

While application of American Lumber Standards has not been achieved to the fullest extent, either by retailers or manufacturers, there should be unstinted support given to those standards by the associations of the industry, said the speaker. While nominally the standards have been in use since July 1, 1924, some of the manufacturing organizations did

Gladstone 3038

not until very recently complete the revision of their rules to comply with these standards. This will mean that some months will elapse before all orders are placed in accordance with the new standards, and some time will be needed to educate the consuming public to the advantages in so ordering.

However, he said, this does not mean that the delay has been general, for there has been good progress made in many sections of the country—a progress so real as to make the matter of adverse legislation far less likely to occur.

"The continued study of the problem," said Mr. Gately in conclusion, "inevitably impresses upon an observer the fact that the agreed upon recommendations must be put into effect. Then, as the various difficulties and obstacles arise, careful note should be made of them, and a bona fide set of evidence built up for presentation to the general conference. Such evidence should be built up as data and information which can be used in securing an honest determination of an all around satisfactory agreement. I therefore urge you most earnestly to give your fullest and most active support to a harmonious continuance of the movement.

"The Department of Commerce will most gladly welcome any opportunity to assist or co-operate in every way possible with the various state, regional and national associations, and it is hoped that, if, in the past there has been any feeling of diffidence in calling upon us for such

SALES REPRESENTATIVE WANTED

High grade man, calling on architects, builders and large plant owners in Philadelphia and vicinity, to sell with other lines, a new and highly successful stair tread. This line represents a new principle in treads and covering, thereby offering new sales possibilities. State age, experience and nature of lines already handling. Address Box G 10, Builders' Guide.

aid and assistance as we may render, you will now understand that there is no real need for such an attitude."

A remarkable document, designed to raise the standard of American homes built in the future, has been prepared by the Licensed National "Own Your Home" Expositions, aided by some forty national trade organizations and associations in the building and allied industries, building, city planning and other experts and interior decoration authorities, and will be used as a guide in staging the Expositions to be held this Spring in Chicago, New York City, Philadelphia and Buffalo.

The recommendations in this Code of Ethics will be brought before the attention of at least a half million people who will visit these annual Expositions, as steps are being taken to publish the Code so it will be available to the public throughout the country.

Never before in the history of business have great national interests gathered around a table and put on paper expert opinion on how an important phase of our national life could be improved. Yet such organizations as the American Society of Civil Engineers, the American Institute of Architects, The Society for Electrical Development, the American Face Brick Association, The Master Plumbers' Association, The Warm Air and Ventilating Association, The National Electric Light Association, The Associated Tile Manufacturers, The Portland Cement Association, The United States League of Local Building and Loan Associations, The American Fuel Oil Burner Manufacturers' Association, The National Lumber Manufacturers' Association, The Wall Paper Manufacturers' Association, The National Retail Lumber Dealers' Association, The National Wholesale Lumber Dealers' Association, The American Gas Association, The Associated Metal Lath Manufacturers, The American Society of Heating and Ventilating Engineers and

A cast iron, sectional side feed, up-draft, low water line (50"), smokeless boiler. Easy to install, simple to operate, exceptionally durable.

ST. BERNARD'S SCHOOL, CHURCH AND PARISH HOUSE, BRADFORD, PA.
All three buildings heated by one installation of three No. 8-40 Novelty Carburetor Boilers. Radiation, 13,000 Sq. Ft.
Architect: North-Shelgren-Swift, 511 Crosby St., Buffalo, N. Y.
Heating Contractor: W. Hugh McQuilken, Bradford, Pa.

How the Architect Solved this Problem

The architect faced a trying situation in planning the new School Building for St. Bernard's Parish, Bradford, Pa.

The Church, about 150 feet away from the site of the School, was fitted with a steam heating system. The Parish House, about 300 feet away from the School site, was equipped with hot water heat. In the interests of economy and convenience it was found desirable to combine these two dissimilar heating systems with the new heating system to be installed in the School.

The architect solved his problem with utmost satisfaction, thanks to the adaptability of the Novelty Carburetor Boiler. The hot water pipes and radiators in the Parish House were not disturbed—the water is heated by steam from the Carburetor Boiler. The radiating system in the Church was simply disconnected from the old boiler and connected to the Novelty through underground mains. All three buildings are assured of all the heat required, even on the coldest days, yet on warm days or days when one or two of the buildings are not in use, no fuel is wasted, because any of the three Novelty No. 8-40's can be shut down as desired.

A side-feed, sectional boiler, the Novelty is admirably adaptable to large buildings. The Carburetor Chambers (one to each section) on the rear of the boiler, automatically mix all smoke, soot and carbon with oxygen from the air and burn them. The air enters top and bottom slots in the rear of each carburetor, as shown in the picture. No adjustment of air intake is necessary. Rate of combustion determines amount of air required.

Write for illustrated and descriptive booklet giving worth-while facts about space-saving, low water line of 50", long life and fuel saving. Address Dept. B G-2, at the nearest office.

tric light metal lath, tile and marble work, iron stairs. Revised plans in progress.

Residence and Garage, Northfield, N. J. Architect, D. W. B. Haining, Guarantee Trust Building, Atlantic City. Owner, name withheld. Brick, 2½ and 2 stories, 53x32 feet, 30x20 feet, slate roof, hardwood and concrete floors, hot water heat, electric light, tile work. Plans in progress. Architect will be ready for bids in two weeks.

Hotel Biltmore (alts. and add.), Atlantic City, N. J. Architect, J. R. Ogden, 143 South South Carolina avenue, Atlantic City. Owner, William Malamut, Hotel Biltmore, Atlantic City, N. J. Brick, steel, 3 stories, 27x92 feet, tile and slag roof, tile, marble and wood floors, roof ventilators, heating extension, electric light, tile work, copper bay windows, ornamental iron work, entire building to be stuccoed. Plans in progress. Architect will be ready for bids in two weeks.

Apartment, New Hampshire and Oriental avenues, Atlantic City. Architect, D. W. B. Haining, Guarantee Trust Building, Atlantic City. Owner, H. Gold, 714 Sewell avenue, Atlantic City, N. J. Brick, 3 stories, 36x70 feet, slag roof, hardwood and tile floors, hot water heat, electric light, tile work. Owner taking sub-bids.

Cottage, Margate City, N. J. Architect, J. E. Sindoni, Norwood and McKean streets, Philadelphia. Owner, P. Labocetta, Eighth and Christian streets, Philadelphia. Cinder block, stucco, 2½ stories, 16x38 feet, asphalt shingle roof, pine floors, electric light, plumbing, tile work. Plans completed. Architect ready for general bids.

Apartment, Atlantic City, N. J. Architect, J. V. Mathis, Guarantee Trust Building, Atlantic City. Owner, Miller A. Cuskaden, Atlantic City, N. J. Brick, steel, 5 stories, 50x85 feet, slag roof, hardwood floors, elevators, terra cotta, ornamental iron work, iron stairs, limestone, tile and marble work, metal lath, electric light, hot water heat. Architect taking sub-bids.

Apartments (2), Ventnor, N. J., \$55,000 each. Architect, Bertram Ireland, Guarantee Trust Building, Atlantic City. Owners, Yarmov & Shenkman, Guarantee Trust Building, Atlantic City, N. J. Brick, steel, 3 stories, 40x80 feet, slag roof, hardwood floors, hot water heat, electric light, metal lath, tile work. Owners taking sub-bids.

Garage, New York avenue and Boardwalk, Atlantic City, N. J. Architect, C. H. Conover, Jr., Freeman Building, Atlantic City, N. J. Owners, H. and Max Weinmann, Colonial Trust Building, Philadelphia. Steel, concrete block, 3 stories, 50x170 feet, slag roof, concrete floors, (1) elevator, roof ventilators, floor hardener, rolled steel sash, hot water heat, electric light. Architect and owners will be ready for bids in one week.

Residences (97), Twentieth and Harrison avenue, Camden, N. J. Architect, private plans. Owner, Joseph Halbert, 6550 Paschall avenue, Philadelphia. Brick, 2 stories, 16x40 feet, slag roof, hardwood and pine floors, hot water heat, electric lighting, metal lath, cement work, garage in basement. Owner will start first 26 March.

School, Pennington, N. J. Architect, J. O. Hunt, Hunt Building, Trenton, N. J. Owners, Board of Education of Hopewell Township, H. H. Pittinger, Hopewell, N. J. Brick, steel, 2 stories, 156x78 feet, built-up roof, maple floors, hollow tile, safety treads, metal ceilings, dampproofing, ornamental iron work, iron stairs, bond, metal lath (heating, plumbing and electric separate). Owners taking bids due February 16th.

School, Hopewell, N. J. Architect, J. O. Hunt, Hunt Building, Trenton, N. J. Owners, Board of Education of Hopewell Township, H. H. Pittinger, Hopewell, N. J. Brick, steel,

2 stories, 172x78 feet, built-up roof, maple floors, hollow tile, safety treads, metal ceilings, dampproofing, ornamental iron work, iron stairs, bond, metal lath (heating, plumbing and electric work separate). Owners taking bids due February 21st.

Church, Ventnor, N. J. Architect, Robert J. Reilly, 50 West Forty-first street, New York City. Owners, Church of St. James by the Sea, Rev. P. J. Petri, Ventnor, N. J. Brick, cut stone, steel, stone, 1 story and basement, balcony, 115x63 feet, slate roof, slag roof, cement and maple floors, steam heat, electric light, metal lath, tile and marble work, plumbing, waterproofing, ornamental iron work, ornamental plaster, bluestone, cast iron pipe. Owners taking revised bids due February 15th.

Department Store (alts. and add.), Atlantic City, N. J. Architects, Magaziner, Eberhard & Harris, 603 Chestnut street, Philadelphia. Owner, Adolph Preis, Mt. Vernon and Atlantic avenues, Atlantic City. Steel, slow burning, 5 stories and basement, 55x100 feet (heating, steam, plumbing, electric light reserved), slag roof, maple floors, hollow tile, maple floors, elevators, waterproofing and dampproofing, ornamental iron work, iron stairs, rolling steel sash, tile and marble work, metal lath. Architects taking bids.

Windshield, Park Place, Atlantic City, N. J. Architect, H. A. Stout, Guarantee Trust Building, Atlantic City. Owners, Department of Streets and Public Buildings, Atlantic City, N. J. Steel, glass and wood, 300 feet long, mill work. Architect taking bids due February 26th.

Residence, 1209 North Thirty-second street, Camden, N. J., \$4,000. Architect, private plans. Owner, Ernest A. Borman, 1232 North Thirty-fourth street, Camden, N. J. Frame, 1½ stories, 24x38 feet, slate surface shingle roof, hardwood and pine floors, electric light. Owner will build.

Store (add.), 446 Broadway, Camden, N. J., \$3,500. Architect, private plans. Owners, Marenickolas Brothers, on premises. Brick store front, iron doors, underpinning foundations, lowering floors, brick add., 1 story, 4x25 feet. Contract awarded to Sol J. Frisch, Clementon, N. J.

High School, Freehold, Monmouth County, N. J. Architect, Alex. Merchant, New Brunswick, N. J., and Fred Eldassu, Newark, N. J. Owners, Board of Education of Freehold, A. J. Cabover, Freehold. Lowest bidder: Joseph Check, South River, N. J., \$197,510.

New Jersey Contracts Awarded

Auto Sales Room, 2119 Federal street, Camden, N. J., \$5,740. Architect, Joshua C. Jeffers, 312 Market street, Camden, N. J. Owner, William C. Davis, 2121 Federal street, Camden, N. J. Brick and concrete block, 1 story, 20x100 feet, slag roof, cement floors, steam heat, electric light. Contract awarded to Richartz & Furrer, 1838 Fillmore street, Camden, N. J.

Residence, Morris Heights, N. J. Architects, W. W. Slack & Son, St. Regis Building, Trenton, N. J. Owner, Benjamin C. Skirm, 702 Riverside street, Trenton, N. J. Brick, 2½ stories, 36x42 feet, slate roof, hardwood floors, hot water heat, electric light, tile work. Contract awarded to T. Ewald, Morris Heights, N. J.

Residence and Garage, Sea Girt, N. J. Architects, W. W. Slack & Son, St. Regis Building, Trenton, N. J. Owner, Charles Shick, care of architects. Frame, 2 stories, 60x30 feet, shingle roof, hardwood floors, hot air heat, electric light, tile work. Contract awarded to H. Conover, Sea Girt, N. J.

Miscellaneous Construction News

Club House, Winston-Salem, N. C. Architect, Charles Barton Keen, 338 South Smedley street, Philadelphia. Owners, Pine Valley Golf Club, Winston-Salem, N. C. Plans completed. Architect will be ready for bids in a few days.

Hotel, Alexander, Virginia. Architects and engineers, Day & Zimmerman, 1600 Walnut street, Philadelphia. Owners, Northern Virginia Hotel Corporation, Alexander, Va. Brick, cut stone, steel, 6 stories and basement, 100x113 feet, slag roof, cement floors, elevators, steam heating, electric light, metal lath, tile and marble work, rolled steel skylights, ornamental iron work. Engineers will build. Ready for sub-bids in 10 days.

Residences (2), Wilmington, Del. Architect, John A. McKibbin, Industrial Trust Building, Wilmington. Owner, T. F. Magarity, 900 South Broome street, Wilmington, Del. Brick, 2½ stories, 20x30 feet, composition and tin roof, hardwood floors, hot air heat, electric light. Owner taking bids.

Residences (2), Wilmington, Del., \$5,000 each. Architect, John A. McKibbin, Industrial Trust Building, Wilmington. Owner, E. W. Samworth, 439 South Sycamore street, Wilmington, Del. Brick, 2½ stories, 20x30 feet, composition and tin roof, hardwood floors, hot water heat, electric light. Owner taking bids.

Miscellaneous Contracts Awarded

Residence (alts.), 78 West Forty-seventh street, New York City. Architects, Hoffman-Henon, Finance Building, Philadelphia. Owner, A. R. Boyd, care of architect. Carpentry and mill work, sheet metal work, plastering, painting and glazing, hardware, plumbing, steam heat, electric work, bond, shoring, limestone, steel iron work, metal lath, pine floors, galvanized iron skylight, slag roof. Stadium, Pittsburgh, Pa. Engineers, Stone & Webster, Boston, Mass. Owners, University of Pittsburgh, Pittsburgh, Pa. Reinforced concrete, 600x800 feet, concrete floors, steam heat, electric light, plumbing, waterproofing. Contract awarded Turner Const. Co., 11 Goodall street, Buffalo, N. Y.

Proposal

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., February 3, 1925. SEALED PROPOSALS will be opened in this office at 3 P. M., March 2, 1925, for repairs to and completion of the Mechanical Equipment, at the Immigration Station, Baltimore, Md. Drawing and specifications may be obtained from the Custodian of the Station at Baltimore, Md., or at this office in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., February 3, 1925. SEALED PROPOSALS

will be opened in this office at 3 P. M., March 2, 1925, for Miscellaneous items of Repair, Restoration and Completion (including removal of certain temporary structures, re-roofing, exterior and interior painting, etc.) at the United States Immigration Station, Baltimore, Md. Drawings and specifications may be obtained at this office in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., February 27, 1925. SEALED PROPOSALS will be opened in this office at 3 P. M., February 19, 1925, for the construction of a one-story fireproof garage, approximately 29,500 square feet ground area, for the Government Fuel Yards, Bureau of Mines, Department of the Interior at Washington, D. C. Drawings and specifications may be obtained at this office in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

(Continued from Page 84)

many others, have joined hands to teach the public how to become home owners instead of rent payers, and then how to build better homes and so protect their investments.

In this connection, officials of these trade organizations state that a wide dissemination of the principles included in this Code will in time banish unscrupulous contractors, building supply dealers, and firms engaged in selling shoddy and flimsy material. In addition, it is also stated, that this will not only benefit the general public by giving them better homes, but be of assistance to the reputable firms engaged in selling building materials, plumbing equipment, heating and ventilating systems and other products who are often blamed for faulty construction, and cheap substitutions. In other words, in the opinion of the experts engaged in the preparation of this unique paper, the public is often apt to blame the exterior stucco used when it cracks or the wall paper when it tears, though faulty construction and defective frame work may be entirely responsible. Similarly, the uninformed are apt to hold guilty the contractor of a well built house if a poor heating plant makes trouble for the owner. The education of the public on correct methods and the use of good materials will, therefore, also protect reliable contractors and reliable firms.

Following are some of the "high points" of the Code that have caused widespread comment among the allied trades:

1. The Exposition cannot recommend the purchase of homes built for speculation unless such homes have been built from properly executed plans, and honestly constructed under the advice of competent authority.

2. The Exposition opposes the exploitation of the public through the selling of flimsily built, improperly planned structures, or materials and equipment which do not comply with

recognized standard specifications of manufacture.

3. In standing for honest construction the Exposition realizes the possibilities of substitution of shoddy for good materials that poor workmanship will weaken a house, increase the upkeep and reduce its useful life to a very few years; that failure to properly insulate the house will greatly add to the fuel consumption * * * that the home builder or home buyer should learn the fundamental principles of good construction methods in order that he may not be misled into building or buying a badly planned, poorly constructed home.

4. The Exposition does not approve exhibits of any real estate firm or corporation unless it is in position to offer with the purchase of the lot a definite proposition for the financing of the home.

5. The Exposition believes that the laying out of subdivisions or building development sites should be in keeping with a harmonious plan of city or suburban community development along scientific city planning lines, that proper restrictions be provided, including zoning laws to prevent the damaging of property due to the encroachment of factory and business sections or residential property.

6. The Exposition believes that the prospective purchaser of a home or a homesite is entitled to what is generally known as the unearned increment due to the gradual development of the community after the purchase has been made, and that the sale prices of all property, at all times, should be based on its value at the time of the purchase.

7. The Exposition in recognizing the co-operatively owned apartment as a home, realizes that there are many so-called co-operative or tenant ownership plans advanced, many of which have not as yet been given the test of time, and is therefore, for the present in a position to recommend but one form of co-operative ownership, generally referred to as the 100 percent tenant ownership plan and organized on the standardized basis approved by the National Association of Real Estate Boards.

8. The Exposition believes that home savings accounts should be encouraged by trust companies, savings banks, and savings and building loan associations, and that the funds established through such saving accounts should be used exclusively for the financing of homes and that due recognition should be given good construction by granting higher loans.

9. The Exposition does not approve exhibits of any building materials unless there is assurance that the manufacturer can finance ample production to supply the demand * * * nor does it approve exhibits staged for the purpose of financing or promoting stock sales.

10. The Exposition, while recommending the use of standard building materials, encourages the production and use of other suitable materials, when such materials have, through tests under proper engineering supervision, proven of substantial value.

11. The Exposition recommends that home builders do not attempt to economize in the construction of their homes by selecting poor equipment because it is cheap, and that true economy is in careful planning and then buying good material as cheaply as possible and seeing to it that they are properly installed.

12. * * * The Exposition has adopted a rule that no products will be accepted for exhibition unless the manufacturer complies with such standard specifications as are adopted by their respective national associations or that the product has been approved and recommended by the exhibit committee under whose classification it belongs.

13. The Exposition believes that the love of home is largely begotten and maintained by using good taste in the decoration of the rooms, choice of furnishings and proper lighting.

14. The Exposition believes that an appropriate landscape development, such as involves no extraordinary expense, either in initial outlay or in upkeep, is a very real insurance against deterioration of the home property.

In a paragraph covering the general supervision of the Expositions in all four cities, the Code states that the Committees of Administration are unequivocally opposed to irrelevant exhibits, misrepresentation, amusement features, circus stunts, distribution of souvenirs, importuning of visitors, ballyho-ing or distracting noise.

ANCIENT AND MODERN DECORATIVE TILE

Tile was one of the earliest of man's manufactures. The ancient Assyrians who used brick extensively, both structurally and decoratively, embellished their buildings with tile of brilliant color. Elaborate picturizations of heroes, monsters and storied legend were not uncommon, and even in that dawning day of civilization, glazed tile had its decorative importance.

Ancient Persian luster is known through the tiles with which the walls of mosques and public buildings were decorated. Arabesques, birds and animals, figures of people were all common motives. The designs were usually received in a lustered ground relieved by scrolls, curls and dots etched in the luster, and showing beneath the ivory white tin-enamel with which the early wares were coated.

Most Oriental countries developed the use of tiles magnificently throughout the middle ages. Persia, Constantinople, Damascus, Cairo and Moorish Spain are

especially renowned for the beauty of their efforts. There are some tiles, evidently parts of sets, which, when complete, formed larger and more elaborate patterns. In others, each individual tile is complete in itself as to design. On certain mosques towers of northern Africa, faience tiles follow a checkered pattern, and in brilliant colored grouping, alternate tiles are identical, one with the other, while the others vary in the fullest measure.

From the twelfth to the sixteenth century a special lustered tile was used extensively for dadoes, friezes and other parts of wall surfaces. These were frequently made in large slabs modeled in bold relief with sentences from sacred books. Often a deep blue upon a cream enamel was the foundation, and in the last firing, tiny ornaments in copper luster were added to increase the richness.

The conquering Romans used tile lavishly both indoors and for exterior color, but since the subjects were to a noticeable degree taken from Greek history, it is believed that the work was done by Greek artists in Italy.

With the Arabs and Moors in the eighth to twelfth centuries the use of tile as practiced by these people was introduced to Europe. Its popularity in the Mediterranean countries was logical. The climate was hot, interiors were shaded and dark, furnishings were few. Tile offered a surface that was cool, that reflected such light as there was, that was easily cleaned, and, appealed to those color-loving peoples for its decorative quality as well.

These very virtues made its progress slow to the North, where warmer textures were preferred, and where the more extended use of window glass later made the reflecting surface of tile unnecessary. That tile, however, was well thought of even in these more rugged climes is readily demonstrated by the use in Germany and Switzerland, of tiled stoves, a fine example of which has been set up in the Metropolitan Museum of Art, showing to what extent tile may be embellished. Here it bears Biblical history in each of many panels adorned by borders and other designs, and setting forth the story in script as well as pictures.

The English were rather apathetic to most phases of the ceramic art, and it was well into the fourteenth century before anything worthy of notice was evolved. Then, however, beautifully designed encaustic or inlaid flooring tiles were made by monastic orders, their art probably brought from the Continent. The designs were first empresse in the clay and the depression filled in with clay of another color.

The difficulty of regulating the composition of these clays so that they should shrink equally during firing was consid-

erable. It was, however, overcome, and innumerable variations were carried out in the designs. Many beautiful pavements of these encaustic tiles may be seen today in Westminster Abbey, Ely Cathedral and other ecclesiastical structures. With the downfall of the monasteries under Henry VIII, the practice ceased in England and foreign tiles were imported for the next two hundred years following. Many of the tiles of medieval days were emblematic and decorated with royal arms, religious symbols and the like.

The earliest form of stamped Spanish tile decoration was suggestive of mosaic, pieces of enamelled tile of various colors being arranged in geometric patterns combined with glass or stone for the purpose. In the fourteenth century and also in the fifteenth, this process was supplanted by one in which the several units of tile were divided rather by means of narrow bands of the same material. The pattern was originally large in scale, requiring many separate pieces to make up one unit of the design. The lavish tile work of the Alhambra was largely of this character.

Spanish tiles with intaglio patterns filled in with colored glazes were extensively produced in the sixteenth century. These are known as Cuenca tiles, and while not suitable for floors are very decorative when used for walls.

The term majolica was first applied to Hispano-Moorish lustered faience brought into Italy from western Spain via Minorca, and then to faience made in Italy chiefly during the fifteenth and sixteenth century. The clay was first fired, then coated with an opaque tin-enamel, upon which the decoration was painted, then again fired. Faience is the term applied to majolica manufactured at Faience, the most important pottery centre in Italy. There is more restraint of tone in Italian Renaissance work than in either the Spanish or the Oriental, in which brilliant color is conspicuous.

Dutch tile, of enameled earthen ware, was usually painted in blue. The use of tile in Holland was principally for wainscoting, as the Dutch builders found it less expensive than wood and very decorative. Scriptural subjects were most in evidence, but many others were architectural landscape and domestic scenes. The architectural tiles include a water gate and towers, a bridge a walled town and a group of buildings. There are landscapes in which houses and rivers and mountains are seen, as well as others where shepherds tend their flocks and men fish.

Tile making in the modern sense dates in Europe at about 1830 when Samuel Wright, a potter of Shelton, England, was granted a patent for the manufacture of tile by mechanical means.—*Associated Building Contractor of Illinois.*

Clausen,

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

These Preserving People Preserve Their Concrete Floors with "ANTI-HYDRO"

The concrete floor in the basement of this building is constantly subjected to the severe conditions peculiar to this industry. Yet "ANTI-HYDRO" has so thoroughly and permanently hardened the concrete that it is unaffected by acids, oil, water and wear. "ANTI-HYDRO" is extremely easy and economical to use. Being a liquid, it mixes readily with the gauging water and through the concrete, insuring uniform strength and hardness to the concrete. It accelerates the set of cement without weakening it and so enriches it that much of the finishers' time is saved and overtime work is eliminated.

For 20 years "ANTI-HYDRO" has been the accepted standard. Results are always permanent and results are what count. Use it on your next job.

As The Editor Sees It

"CONSTRUCTION AND CONSTRUCTION MATERIALS"

*A Handy Summary of Facts and Figures
on the Construction Industry Issued
by the Department of Commerce*

The Department of Commerce announces the reprinting of the articles on Construction and Construction Materials from the Commerce Yearbook for 1923, in a separate pamphlet. The reprint includes a 24-page article on "Construction" and 19 pages devoted to certain construction materials, namely, lumber, cement, structural steel, burned clay materials, building stone, crushed stone, sand and gravel. The text contains twenty-five concise tables of basic statistics, and five diagrams to show principal tendencies.

"Construction" Defined

The term "construction" is used "to cover the construction and alteration of buildings, roads, canals and locks, bridges, railroads, harbor works, subways, tunnels, water supply systems, and other work that produces a more or less fixed structure or alteration of the natural topography. The term is not used here to cover ships, railway rolling stock, or movable machinery.

'Construction activity is most properly measured in terms of employment of men and equipment and consumption of materials and supplies. Since figures covering these points are not now avail-

able, those showing contracts awarded and building permits, corresponding in a general way to statistics of sales in manufacturing industries, must be used very largely instead."

It is pointed out that actual building takes place after permits have been taken out or contracts awarded, so that great activity in building may continue for some time after a marked falling off in these indicators. The fact is also brought forward that according to the National Bureau of Economic Research from 8 to 12 per cent. of the national income went into construction each year from 1909 to 1916, and the figure for 1923 was probably within this range.

Relation of Construction to General Conditions and Business Cycles

"The degree of activity in construction bears a close relation to general business conditions. Extensive construction and equipment of new buildings results not only in large employment of building-trades labor but in active production of lumber, cement, iron and steel products, nonferrous metals, brick, stone, sand and gravel, lime, hardware, paint, electrical equipment, furniture, textiles, etc. If building falls off there is bound to be a slackening in many other lines of industry.

"Building activity is influenced both by the cost of the building and by interest rates. High prices, high wages, and high interest rates are likely to accompany

each other in the business cycle, and when the feeling becomes general that they are due to decline, building operations ordinarily slacken.

"When building activity is lowest, which is generally during a period of business depression, an upward tendency is likely to start before general business conditions show marked recovery. Low building costs are apt to bring into the market home builders and organizations that have saved up money. Municipalities can float bonds at low interest rates, and this tends to stimulate public works. Industrial building, however, appears to follow the requirements of expanding industrial activity and is more likely to be at a peak when the cost of building is high.

"Periods of great building activity and of dullness are apt to follow in quick succession owing to the lack of co-ordination between selling and producing efforts which has characterized the industry.

"It happens not infrequently that local shortages of one or more building materials arise because of a demand greater than anticipated by dealers, on account of transportation delays, or because of difficulty in obtaining prompt shipments from producers, or perhaps from a combination of all three circumstances.

It is pointed out that the highest rate of building operations is reached in June, July, August and September. This fact

**DRAWING
MATERIALS**

CHARLES H. ROBBINS CO.

1729-31 Sansom Street, Philadelphia

BELL PHONE, RITTENHOUSE 7530

KEYSTONE PHONE, RACE 3519

**BLUE
PRINTS**

was brought out in a survey of Seasonal Operation in the Construction Industry made by the Division of Building and Housing of the Department of Commerce. Although construction contracts and building permits are customarily higher in the spring months, the maximum employment of men and consumption of materials does not result until the summer.

In connection with the index numbers of building material prices and construction costs, it is pointed out that most construction is performed on the basis of contracts let at the start of the operation, and contractors in submitting estimates take into account anticipated changes in costs; hence not one index can represent exactly the costs both to the owners and the contractor. An index for one class of buildings using certain materials and constructed largely with unskilled or semi-skilled labor would vary decidedly at times from an index for a highly finished structure using largely other materials and in which a large percentage of skilled labor is utilized.

Among other leading points in the article on "Construction" are a discussion of tables showing contracts awarded by months for various classes of construction for five years; the proportion different classes of construction form of total construction for five years; a table of index numbers of building material prices, and construction costs; a discussion of certain building trades labor problems, financing of building operations, factors affecting the demand for new construction, the simplification and standardization of building materials, tendencies in the municipal regulation of building, building research, and the movement supported by Secretary Hoover to distribute building activity better throughout the year, and in relation to the business cycle.

The slight increase in building costs shown by the figures for January is not to be taken as the beginning of a general rise, according to the interpretation placed

upon the statistics by officials of the Associated General Contractors of America.

In a statement issued February 11, it was pointed out that the slight increase noted during the past month was due to a minor advance in labor rates and material prices in a few cities. The average cost of construction in the principal building centers of the country rose one point during January to reach the index number 202.

The volume of construction in January, as indicated by shipments of materials, dropped thirty-five points below the index figure of 155 for the preceding month, due to a cold-weather slackening of operations. This decline is not believed to forecast any significant curtailment of construction during the coming year. The total volume for 1924 was the greatest on record, being four per cent more than that of 1923, which in turn was sixty-three per cent higher than that of 1913.

Though awards of building contracts in a group of twenty-seven northeastern states fell in their total to some thirty points below the figure for the two preceding months, a study of the general trend indicates the probability of continued high activity during 1925. This same indication is carried by totals of building permits issued in twenty cities.

SAND LIME BRICK MAKERS ADOPT SIMPLIFIED SIZE

Following the example set by the face brick and common brick industries, the Sand Lime Brick Association, at a convention held recently in Toronto, Canada, adopted recommendations to the effect that, beginning August 1, they would concentrate on one "recognized" size of sand lime brick. This size will supplant 45 varieties now made, and will be 8 inches long, $3\frac{3}{4}$ inches wide and $2\frac{1}{4}$ inches thick.

The action was taken as a result of co-operation of the Division of Simpli-

Brick, steel, cut stone or terra cotta, 4 stories and basement, 110x136x180 feet, irregular, slag roof, cement, pine and terrazzo floors, plumbing, plate glass, metal bulks, wood sash, tile and marble work, steam heat, electric light. Contract awarded J. T. Hallahan, 2313 Walnut street, Philadelphia.

Garage, Chester Hospital, Chester, Pa. Architect, private plans. Owners, Chester Hospital, care of Kingsley Montgomery, Chester, Pa. Brick, steel, concrete, 2 stories, 40x50 feet, slag roof, cement and pine floors, electric light, tile work. Contract awarded William Provost, Jr., Chester, Pa.

Bank Building, Narberth, Pa. Architects, Wallace & Warner, Franklin Trust Building, Philadelphia. Owners, Merion Title & Trust Co., Ardmore, Pa. Brick, 1 story and mezza-

nine, and 2 stories, 70x41 feet, steam heat, electric light, tile work, slag roof, composition floors, marble work, bank fixtures. Contract awarded W. D. & H. T. Smedley, Narberth, Pa.

Residence, Jenkintown, Pa. Architect, C. A. Ziegler, 1012 Walnut street, Philadelphia. Owners, Herkness & Stetson, Land Title Building, Philadelphia. Stone, 2½ stories, hot water heat, electric light, tile work, shingle roof, hardwood floors. Contract awarded E. Allen Reeves, Abington, Pa.

Residence and Garage, Lot No. 14, Duell Tract, Meadowbrook, Pa. Architect, Carl A. Ziegler, 1309 Locust street, Philadelphia. Owner, name withheld. Brick, stucco, frame, 2½ and 1½ stories, 41x28 feet, garage 21x18 feet, shingle roof, oak and pine, cement floors. Contract awarded Stahl & Walton, Willow Grove, Pa.

Rectory, Norwood, Pa. Architects, Frank V. Nickels and C. J. Mitchell, 15 South Twenty-first street, Philadelphia. Owners, St. Gabriel's Parish, Rev. J. Smith, Norwood, Pa. Stone, cut stone, limestone, 2½ stories, 35x49 feet (heating, plumbing, electric reserved), slate roof, oak and pine floors, bond, ornamental iron work, bluestone. Contract awarded Farrell Roth Const. Co., 1624 Spruce street, Philadelphia.

Residence and Garage, Lemoyne, Pa. Architects, Lawrie & Green, 116 Locust street, Harrisburg, Pa. Owner, Bertha L. Lilly, 20 North Fourth street, Harrisburg, Pa. Local stone, 2 and 1 stories, 40x30 feet and 18x20 feet, slate or tile roof, hardwood floors, hot water heat, electric light. Contract awarded to J. F. Barnhart, Mechanicsburg, Pa.

Residence, Academy Manor, Pa. Architect, C. J. Lappley, Cotterel-Ebner Building, Harrisburg, Pa. Owner, A. G. Eden, 925 North Front street, Harrisburg, Pa. Brick, cinder block, cut stone, stucco, 2 stories, 63x38 feet, hardwood floors, Spanish tile roof, steam heat, electric light, tile and marble work. Contract awarded to W. E. Bushey, Lemoyne, Pa.

Residence, Lancaster, Pa. Architect, H. Y. Shaub, 20½ North Queen street, Lancaster, Pa. Owner, Mr. Wolson, care of architect. Brick, 2½ stories, 24x60 feet, slate roof, hardwood floors, hot water heat, electric light, tile work. Contract awarded to H. L. Wiant, 544 Mill street, Lancaster, Pa.

Factory, Lancaster, Pa. Architect, H. Y. Shaub, 20½ North Queen street, Lancaster, Pa. Owner, W. W. Kaeffer, care of architect. Concrete block or brick, 1 story, 40x160 feet, slag roof, concrete floors, vapor heat, electric light, rolled steel sash, fire doors, roof ventilators. Contract awarded to B. Frank Bachman, Woolworth Building, Lancaster, Pa.

New Jersey

Construction News

Hospital, Trenton, N. J., \$500,000. Architect, not yet selected. Owners, St. Francis' Hospital, Chambers and Hamilton streets, Trenton, N. J. Work contemplated.

School (add.), Hainesport, N. J. Architects, P. L. Fowler Co., Fitzcharles Building, Trenton, N. J. Owners, Lumberton Township Board of Education, M. C. Gaunet, president, Hainesport, N. J. Brick, 2 stories. Plans in progress.

Church and Sunday School, Palmyra, N. J. Architect, H. Rush Stevens, 1827 Arch street, Philadelphia. Owners, Central Baptist Church, Palmyra, N. J. Stone, 1 story and basement, 40x150 feet. Preliminary plans in progress.

Bank, Medford, Burlington County, N. J. Architect, Thomas E. Ash, 1012 Walnut street, Philadelphia. Owners, Burlington County National Bank, Medford, N. J. Brick, 2 stories, 28x60 feet, slate roof, wood and linoleum floors, vapor heat, electric light,

marble work. Architect taking bids due February 19th at the bank (noon).

Power Plant, Asyla, Camden County, N. J. Engineer, Frank H. Schaefer, 306 Temple Building, Camden, N. J. Owners, Camden County Board of Chosen Freeholders, Court House, Camden, N. J. Foundations, electrical work, bond, ducts, building alterations. Deposit of \$50. Owners taking bids due February 25th at 2 P. M.

Building for Idiots, Building for Low and Middle Grade, New Colony Building, Recreation and Assembly Building, Vineland, N. J. (B. J. Lewis, Comm.). Architects, Division of Architecture and Construction, Department of Institutions and Agencies, Trenton. Owners, State Inst. for Feeble Minded, Vineland, N. J. General construction, plumbing, heating, electric work. Deposit, \$25, refunded. Certified check 5 per cent. of bid must accompany each bid. Architects will take bids due February 26th, 1.30 P. M.

Shop Building, Trenton Junction, N. J. Architects, Guilbert & Betelle, Newark, N. J.; A. H. Moses, Camden, N. J. Owners, New Jersey School for the Deaf, State Board of Education, Trenton. Owners will take bids due March 3rd.

Residences (2), 3322 Remington avenue and 3275 Pleasant street, Camden, N. J., \$3,700 each. Architect, private plans. Owner, William F. Todd, 832 North Thirty-second street, Camden, N. J. Frame, 1½ stories, 24x34 feet, asphalt shingle roof, hardwood and pine floors, warm air heat, electric light. Owner will build.

Contracts Awarded

Twin Residences (2) and Cottage, near Cinnaminson, N. J. Architect, C. E. Schermerhorn, 213 South Fifth street, Philadelphia. Owners, Campbell Soup Company, Farm No. 2, near Cinnaminson, N. J. Frame, 1½ stories, concrete block foundations, cement cellars, floors, asphalt shingle roof, plumbing and drainage, electric wiring, hot air heat, carpentry. Contract awarded G. W. Shaner & Son, Palmyra, N. J.

Miscellaneous

Construction News

Silk Mill (add.), Harrisonburg, Virginia. Architect, C. Emlen Urban, Woolworth Building, Lancaster, Pa. Owner, name withheld, care of architect. Reinforced concrete, 3 stories, 80x140 feet, slag roof, cement and linoleum floors, roof ventilators, waterproofing and dampproofing, iron stairs, rolled steel sash, steam heat, electric light. Plans in progress. Will be ready for bids in about one week.

Library (add.), Fairmount, W. Va. Architect, R. A. Gillis, Fairmount, W. Va. Owners, Fairmount State Normal School, Fairmount, W. Va. Brick, cut stone, granite, steel, 2 stories and basement, 61x63 feet, steam heat, electric light, metal lath, tile and marble work, asphalt built-up roof, cement and composition floors, metal ceilings, dampproofing, ornamental terra cotta, bluestone. Architect taking bids due March 2nd.

Hospital Building, Charleston, S. C. Architect, F. Ferdinand Durang, 1220 Locust street, Philadelphia. Owners, St. Francis Xavier Infirmary and Sanitarium, Charleston, S. C. Associate architect, J. D. Newcomer, Charleston, S. C. Brick, concrete, cut stone, steel, stucco, 2 stories and basement, 102x39 feet, wing 93x40 feet (plumbing, heating, electric and kitchen equipment, elevators, dumb waiters reserved), tile and slag roof, cement and pine floors, hollow tile, architectural terra cotta,

ornamental iron work, bond, kalamein doors, hollow metal sash, tile, marble and terrazzo work, metal lath. Architect taking approximate bid.

Proposal

ADVERTISEMENT FOR THE SALE OF MECHANICAL EQUIPMENT

Public notice is hereby given that proposals will be received for the sale by the County to purchasers of the equipment hereinafter set forth, now the property of the County of Camden, and not presently needed for public use owing to the acquisition or intention to acquire other equipment of like nature.

Said proposals will be received by the Chairman of the Central Plant Committee in the meeting room of the Chosen Freeholders, in the Camden County Court House, Camden, New Jersey, on the twenty-fifth day of February, at 2.00 P. M.

The equipment to be disposed of and for which the County invites proposals to purchase includes the following: Two 180 H. P. brick set return tubular boilers with hand-operated stokers. They were installed new in February 1923, built for 150-lb. steam working pressure. One 146 H. P. brick set horizontal return tubular boiler built for 125-lb. steam working pressure installed new September 1916. One 48 K. W. General Electric Company 220 volt A. C. generator, direct connected to Troy steam engine, installed new February 1922.

All the above material is in operation at the present time and can be seen in operation until March the 1st.

The right is reserved to accept any or all proposals or to waive any informality in any proposal presented. All bids must be in sealed envelopes endorsed "Proposal to purchase mechanical equipment." (No bid will be considered unless accompanied by a certified check to the order of the County of Camden or cash in the amount of 10% of the bid, binding the bidder to execute a contract if awarded to him.)

Any additional information required may be obtained at the office of the Consulting Engineer, Frank H. Schaefer, 306 Temple Building, Camden, New Jersey.

The boilers will be dismantled by the Owner and will be ready for delivery to the purchaser not later than April the 1st, 1925. Engine and generator will be dismantled by the Owner and will be ready for delivery to the purchaser not later than May the 1st, 1925.

Terms of purchase for any or all of the equipment will be on the basis of cash on delivery.

THOMAS C. WRIGHT,
Chairman.

FRANK H. SCHAEFER,
Engineer.

ADVERTISEMENT FOR MECHANICAL EQUIPMENT FOR THE CAMDEN COUNTY CENTRAL POWER PLANT

Public notice is hereby given that sealed proposals for furnishing labor and material to construct, install and equip all apparatus in the Central Power Plant on grounds known as the County Farm near Asyla, Camden County, New Jersey, for the County of Camden, will be received and opened by the chairman of the committee on Central Plant in the meeting room of the Board of Chosen Freeholders, in the Court House, Camden, New Jersey, on the 25th day of February, 1925, at 2 P. M.

The work for which proposals are hereby invited, and for which bids will be received, includes all labor and material necessary to properly construct and install the following: first, foundations, ducts and building alterations; second, electrical work.

The right is reserved to accept or to reject any or all proposals or to waive any informality in any proposal presented. All bids must be in sealed envelopes endorsed "Proposal for Central Plant" and stating the branch of work covered. (No bid will be considered unless accompanied by a certified check to the order of the County of Camden, or cash in the amount of 10% of the bid, the certified check or cash to accompany the bids. In case the bids is less than \$5,000.00, said check or cash must not be less than \$500.00), and also a statement from a Surety Company that it will provide the contractor with a bond, binding the bidder to execute a contract if awarded to him. The terms of the proposal with surety required are fixed by the specifications.

Copies of the drawings and specifications will be on file in the office of the Engineer for the purpose of estimating. A limited number of copies of the plans and specifications will be loaned to prospective bidders on deposit of a certified check to the Engineer's order for fifty dollars (\$50.00). The plans and specifications may be obtained by application to Frank H. Schaefer, Engineer, 306 Temple Building, Camden, New Jersey.

Check will be returned at time of returning plans and specifications, but should they not be returned, the deposit may become forfeited.

County of Camden a municipal corporation of New Jersey by the Committee of the Board of Chosen Freeholders on Central Plant.

THOMAS C. WRIGHT,
Chairman.

FRANK H. SCHAEFER,
Engineer.

(Continued from Page 100)

fied Practice with the industry, the distributors and the consumer interests.

H. Ross Colwell, of the Division, who represented the Department of Commerce at the Toronto meeting, reported that the sand lime brick industry was wholeheartedly in favor of the simplification project recognizing the necessity, in the interests of competition with other products, of a standard size which would be known to all architects, builders, contractors and engineers in construction work.

BRICK EXCELLENT FOR HOME BUILDING

Brick answers the needs of the average builder admirably as it has strength and durability, it is convenient to build with and exceedingly beautiful structures are made of it.

The manufacture and use of brick goes back to the remotest antiquity, far beyond the earliest recorded history, which is supposed to be about 3,800 B. C., fully two thousand years before the time of Abraham.

There is every reason to believe that the brick industry had its beginning in the valley of the Euphrates river. Brick in as good condition as the day that they

were made have been found in excavating the ruins of old Babylonia.

The native Babylonians got the idea for making brick from the irregular sun-baked pieces of clay found along the river bank. It was an easy step in advance to shape the mud while soft and lay it out in the sun to dry, producing for the first time adobe bricks. These were afterwards greatly improved by mixing chopped reeds or straw with the soft mud before baking.

The use of brick in England became so extensive during the eighteenth century that it nearly drove out all the other materials. This accounts for all the fine old country houses so representative of substantial comfort and dignity that are to be found scattered through that country. Today English builders have maintained a fine sense of architectural values as evidenced in the many splendid examples of modern construction.

In America a growing good taste has demanded and secured artistic effects in the brick wall by the use of specially manufactured face brick which in a bewildering variety of beautiful color tones and textures, have been sympathetically and artistically treated by the leading architects.

There is a vast difference between the primitive method of mixing and molding brick by hand and drying them in the sun and the modern technical methods and power machinery used by the American manufacturer. Determined by the kind of material used, whether surface clay, fire clay or shale, and the kind of brick wanted, there are three methods of manufacture, slop-mold, wire-cut, and dry-press.

By the first method the soft clay is pressed into molds by a machine which has been flushed with water—hence the term—slop mold. In the second method the clay or shale is ground and tempered into the consistency of a stiff mud ribbon having the cross section of a brick. This stiff mud ribbon is carried by a belt under a series of piano wires strung on a frame which is revolved by the machine at proper intervals, cutting the clay ribbon into the desired sizes. These stiff mud machines will turn out as many as 100,000 face brick a day, and in some brick plants they are built for a 250,000 to 300,000 daily output. The dry press method reduces the clay to a fine granular form which is then in nearly dry condition forced under immense pressure into the proper sized molds.

The brick as they come from the machines are known as "green" and require, except in the case of the best dry press brick, a certain period of drying before being set in the kilns where from five to ten days, depending on the quality of the ware and the general conditions, they are subjected to a process of burning be-

fore they are ready to be built into the wall.

This process of burning passes through three main stages which require very skilful attention on the part of the burner. First, the water chemically combined with the material must be driven off; then the various impurities of the clay must be burnt out or oxidized; and finally, the ware, except in case of fire clays, must be brought to the point of incipient vitrification. Throughout the whole process there is danger of distortion or discoloration in the ware unless the fires are skilfully handled. Properly done, the brick come out of the kiln in their beautiful, natural colors, due to the constitution of the clay or the various metallic oxides contained in it. To enhance these effects, different clays are sometimes mixed in going through the machines, certain ores may be added to modify the color, the brick surfaces may be scored in various ways, or the ware may be set in the kiln so as to avoid or get the flash of the fire. So that when you specify a fine face brick, you are getting a product which Nature has taken long to create and to which man has devoted his best scientific knowledge and inventive art.

The American manufacturer of face brick has far outstripped the rest of the world in the wide range of color tones and textures he offers. So that the prospective builder has before him the possibility of giving to the exterior wall surface an enduring color scheme of monochrome uniformity or polychrome blending, as his taste may dictate. The whole sweep of color, in smooth or rough textures, is at his command from the pure, severe tones of pearl grays or creams, through buff, golden, and bronze tints to a descending scale of reds, down to purples, maroons, and even gun metal blacks. Thus, instead of building for your client a house of a dull, insubstantial, unattractive appearance, you can, by the use of face brick, build a substantial, enduring house that presents to the eye a veritable symphony in color, at once a satisfaction to yourself as well as to him, and a cause of appreciative remark by his neighbors or the casual passerby. It will always stand to the credit of your art as a builder.

Considering the items as they come, in their effect upon the value of the house. First, there is up-keep. So far as brick enter into the construction of a house, it requires practically no maintenance.

It does not have to be patched, repaired, or painted. It is as sound twenty years after it is built as the day it was built, and even more attractive.

Depreciation, which is a separate item from maintenance or up-keep, is practically nil in the case of the brick house. Appraisal engineers have estimated it at

only one per cent a year for the brick house, beginning after the first five years. This one per cent. really applies only to such portions of the building as are subject to wear, as finished floors, plumbing, hardware and roofs. Approximately 60 per cent of a well built brick house does not depreciate at all through a long period of years.

Of course there is a saving of insurance rates on the brick house, as it is not as great a fire risk as some of the houses constructed of other materials.

Considering the question of comfort and health, there is a uniform comfort which, especially in winter, has a vital bearing on the health and welfare of the family, more particularly as it affects children, old people, or invalids.

There are a number of terms commonly used in brick work that it is helpful to know if one is contemplating having a brick house built. Following are a number of these:

Coping. A row of brick, usually projecting, used to cap or finish the top of a wall and protect it from the weather. It is usually laid up in very rich Portland cement mortar with tooled joints.

Course. A horizontal row of brick in a wall.

Culling. Sorting brick for size, color, and quality.

Culls. The brick rejected in culling.

Diaper. Any continuous pattern in brickwork of which the various bonds are examples. It is usually applied however, to diamond or other diagonal patterns.

Efflorescence. The deposition of a white powder or crust on the surface of brickwork, due to soluble salts usually in the mortar but sometimes in the brick, and, drawn out with the moisture by the sun, left as a deposit on the surface. Brick clays containing these salts are now cured by using a carbonate of barium. Against mortar efflorescence care should be taken to protect all brickwork at eaves and sill courses from excessive moisture. Also *whitewash* or *white-washing*.

Face Brick. A well-burned brick, especially prepared, selected, and handled to secure attractive appearance in the face of a wall, as distinguished from common brick as used for backing or other structural work.

Green Brickwork. Brickwork in which the mortar has not yet set.

Lime Putty. Slaked lime in a soft puttylike condition before sand or cement is added.

Pointing. Inserting mortar into the joints after the brickwork is completed, in order to correct defects left in the progress of the work.

Reveal. The vertical side of a window or door opening from face of wall to frame.

Salmon Brick. The softer brick of the kiln suitable for places protected from outside exposure or where great crushing strength is not required.

Smoke Chamber. The space in a fireplace immediately above the throat, where the smoke gathers before passing into the flue, and narrowed by corbeling to the size of the flue lining above. Also *smoke cavern*.

Soldier Course. A course of stretchers set on end with the face showing on the wall surface.

Throat. An opening at the top of a fireplace through which the smoke passes to the smoke chamber and chimney.

Washing Down. Cleaning the surface of the brick wall, after it is completed and pointed, with a mild solution of muriatic acid.—*Keith's Magazine*.

STEEL REINFORCING BAR SIZES REDUCED TO ELEVEN

The recommendation made as the result of a conference held early in September at the Department of Commerce in Washington, relative to the manufacture and use of steel reinforcing bars—round and square—has received practically the unanimous acceptance by manufacturers, distributors and users throughout the United States.

As published in *The Improvement Bulletin* of September 20 the conference, acting through the Bureau of Standards, recommended that the recognized sizes of square and round steel reinforcing bars, be reduced to the following in terms of cross-sectional area:

Size In Inches	Area In Square Inches
1/4 Round	.049
3/8 Round	.110
1/2 Round	.196
1/2 Square	.250
5/8 Round	.307
3/4 Round	.442
7/8 Round	.601
1 Round	.785
1 Square	1.000
1 1/8 Square	1.266
1 1/4 Square	1.563

It was further recommended that this reduced list of sizes become effective as applying to new production January 1, 1925, and that every effort be made to clear current orders and existing stocks of the eliminated areas before March 1, 1925.

At a recent meeting of the Concrete Reinforcing Steel Institute, made up of members of the reinforcing bar interests of the United States, these recommendations were accepted.

Another step forward to more simplified and economical building has been attained.

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

As The Editor Sees It

UTILIZING LIFETIME

BY GERHART F. MEYNE

*Address before the National Vocational
Educational Society at Indianapolis,
Indiana*

The problem before the Builder and Industrialist is "How can vocations and education be most practically combined?", as the great majority of people must labor at something productive. Educated people without a desire for labor can be an insufferable evil.

I have no particular regard for educational theories, and have no new theories to propound. In educational matters, I am thoroughly old-fashioned, and believe in creating and arousing a desire to learn to be the "Big Thing." I believe acquiring learning is purely a matter of personal practice, interest, an inquisitive turn of mind and concentration.

Within the memory of most of us, the three R's were considered to be the ample system. Half of our citizens have been educated within them. The three R's of today represent a whole lot more in study and education than formerly. There are but few in the United States who cannot read and write fluently. Many in their more mature years have acquired the love for the literary arts, understand the plays and the classics, but the growth of our educational system has all been in the same direction. There is practically no difference in the instruction given to

those who are ambitious to become lawyers, doctors, engineers, architects and other professional men, and the instruction given those who are neither leaning, inclined, nor ambitious towards the professions, who neither have the means, desire, ability nor endowments to enter the professions, but are content to earn an honorable living at a trade or vocation.

Yet most of the education, after the seventh grade, is directed towards the professions. Ninety-two per cent. of our youths do not get to college, approximately two per cent. graduate. Let us look at the somewhat archaic and chaotic system of preparing the ninety-two per cent's lifetime in a practical manner.

Let me answer in the terms of my own industry.

In most of our States, our youths are not permitted to go to work at the building trades until they are sixteen years of age. What are we doing for these youngsters, and how are we utilizing their lifetime for the benefit of themselves, the public and the future employer? It should not be necessary for the young man who desires to become a building tradesman to be required to burden himself with many of the subjects now taught, and in which he has no interest whatsoever. He should not be required to study the same general subjects as the youth who has a leaning or ambition for the professions.

The general tendency in the High

Schools, as I know them, is to encourage students to become members of the professions,—the average high school instructor, Academician, encourages them unduly towards the professions. For some unaccountable reason, the Academician and the American parent seem to think that the professional class and semi-professional class, such as clerks, salesmen, draftsmen, etc., are considered to possess greater gentility, and they are looked upon by the present and past generation as something superior to the mechanic. Could these good people but see the numerous opportunities that are constantly presented to the vocationally trained man who knows his trade fundamentals, and could they but know of his yearly income, they would view him with appreciation instead of depreciation. The vocationally trained man can take advantage of these numerous opportunities by continuing his education in night courses, short term college courses, etc. He cannot only aspire to the heights in industry, but, what is more, if he applies his endowments, training and ability, he can actually "arrive."

Probably nothing indicates the justification for the present demand of vocational education more than the fact that numerous college men graduating from the literary arts and science courses are turning towards the vocations as a means for a livelihood. It is not infrequent that one finds men of several years' col-

lege training endeavoring to get into the industries. When one stops to think of it, one feels that they have not utilized their lifetime to the fullest, have probably acquired considerable needless information. Of course, time spent in any education is not time lost, but many subjects that do not interest the student are taught in our present high schools and the boy who does not go to college must wrestle with them, when his time could be turned to greater practical advantage.

The Federal Board for Vocational Education has made up a chart based on the 1920 census, which shows some very remarkable figures and percentages, when analyzed. It has been published and discussed before.

The Builder and Industrialist who looks at this chart in reverie and meditation (if he will take time to study the chart at all) I believe, will agree with me that the lifetime of our youths could be turned to greater advantage to the Nation and to themselves, if the educator would take advantage of utilizing the years that are so often dribbled away because of lack of interest in the subjects taught. The chart reveals that there are approximately two million of our young, in each of the ages between 5 and 20 years. Taking the two millions of children at the age of 13 and following them through, it will be noted that 92 per cent leave school before the age of 21, to go into some industrial, commercial, or agricultural pursuit. What are we, the public, and you educators doing to prepare them for this new thing that they are facing? Let us go back to the chart! The egress from school is about as follows: 110,650, or 6 per cent, leave between the ages of 13 and 14 years, while 409,450, or 22 per cent, leave between the ages of 14 and 15 years. When we come to the ages of 15 and 16, the figures show that 355,650, or 26 per cent, leave your school for one reason or another; 359,350, or 36 per cent, leave between the ages of 16 and 17; 288,750, or another 36 per cent, leave between the ages of 17 and 18—all of these to engage themselves in some life

occupation. Are we doing everything to fit these young people with an understanding of what confronts them? Have we developed their capabilities to shift for themselves? For, in biological terms, we may consider them weaned.

Now we come to the college age, and find that only a small percentage are left to enter college, and the chart shows that the youths are leaving college at the rate of 100,000 to 200,000 each year, and that only a very small percentage—approximately only two per cent graduate. Yet the entire curriculum, in most instances, from the ages of 13 to 20, has been set and made up for the purpose of entering the youths into college. I ask again, have we utilized the life-time at our disposal efficiently?

There are whole libraries written on vocational and apprenticeship education and training, but there is no need of giving historical back-ground to this subject. I would like to give you the view-point of a builder. He may not be qualified to address you because of his lack of degrees, but he has served apprenticeships in a trade and has worked through the various steps and is proprietor of his business. He is tremendously interested in vocational education. He is training numerous boys under various systems. Personally, I believe the old "Indenture system" has outlived its usefulness. It is no longer necessary for the master to provide shelter, food and clothing for the boy. It is no longer necessary to teach him to read and to write, as usually was his obligation. He now pays him the wage he is able to earn. The parents and school usually provide the other.

I hope to see the time when the public schools of today will be the vehicle of training the industrial arts as were the medieval monasteries of the eighth and ninth centuries. We know that it was usually a willing exchange of manual labor for protection, teaching and subsistence, either within the monasteries or to those who lived near them. Those who would gain knowledge were obliged to

The Pallas Apartment, Atlanta, Ga., Equipped with one No. 6-40 and one No. 11-40 Novelty Carburetor Boiler. Architect: C. E. Frazier, Atlanta, Ga. Heating Contractor: Richardson Plumbing & Heating Co., Atlanta, Ga.

50 inch Water Line

**In large apartments
as well as in small homes**

Selection of the Novelty Carburetor Boiler for this and a host of similar important installations throughout the nation is a fitting tribute to the newest patent boiler—the boiler with the carburetor.

The Carburetor Chambers (one to each section) on the rear of the boiler, automatically mix all smoke, soot or carbon, ordinarily wasted, with oxygen from the air and burn them. The air enters top and bottom slots in the rear of each carburetor, as shown in the picture. *No adjustment of air intake is necessary. Rate of combustion determines amount of air required.*

Write for illustrated and descriptive booklet giving worth-while facts about space-saving, low water line of 50", long life and fuel saving. Address Dept. B G-2, at the nearest office.

Rebuilding first and basement, alterations to upper floors, changing to heating and lighting, maple floors, metal ceilings, metal bulks. Contract awarded C. L. Stobekhausen, Baltimore, Md.

(Continued from page 116)

give their labor free in exchange for learning, protection and living, creating practically a condition of servitude. This condition no longer exists.

The thinking Builder and Industrialist is no longer vying for the Freedom of Labor, but for the Dignity of Labor, and general industrial freedom, and I believe that the time is here where the public

school is taking the place of the old monastery, the time of servitude is past, the time of the old practice of indenture is slowly passing. Especially is this true in the building industry.

The builder is confronted by a peculiar situation in obtaining and teaching boys. The builder is in competition with other employers for the services of the boys. The semi-skilled trades are able to offer to the young man much greater pay than a boy can, in a comparatively short time, acquire the knowledge of running machinery and become a producer. He can earn big money by driving motor trucks and, in his limited course of reasoning, he does not see the opportunities and advantages of becoming a highly skilled artisan. It takes considerable of his time and, by reason of the cost of his training, his pay must naturally be less than that in the semi-skilled trades. We builders, I say, are in competition for these boys, and unless the boys' parents are able and willing to help sustain them for the first few years, it is difficult for us to give the boys all the opportunities they should have to acquire building knowledge. Hence, let us use the public school for this fitting and service.

Now, then, the builder feels that inasmuch as he is paying taxes for the education of the youth of the country, he also has a right to expect some service from this youth. Inasmuch as everybody, including the poorest among us, who has a dollar to spend for their sustenance, is helping pay taxes, and inasmuch as approximately 50% of the entire State taxation is spent for educational purposes, the parents alone are not the only ones interested, but all of us are interested, and we have a right to expect a general service from each other. It is part of our civilization complex. The shoemaker, tailor, baker, merchant, clerk, etc., cannot live without my industry. I cannot lead a comfortable existence without theirs. Now, let us realize that in our educational system, and let us utilize the lifetime at our disposal of the young between the ages of 13 and 20, and those who are not particularly inclined towards the professions, teach them something that will be of advantage to them and advance our industries, and hope that later in their lifetime they will become interested in the fine arts and general cultural attainments.

I do not feel that the entire school periods of the boys between 13 and 20 should be engaged in teaching them vocations, but I do feel that, together with teaching them something practical, the seed and desire for learning can also be planted, and if the boy is endowed with an inquisitive turn of mind, he will learn, by applying himself, much of the culture that is now the requisite of gentility. Should he not be endowed with a desire

to know more than the three R's, no amount of tutoring or cramming between the ages of 13 and 20 will give it to him.

I have often been asked what my plan of education would be, so I will repeat it to you. Those boys who are not interested, or who, by reason of necessity, cannot go into the profession, or whose parents are unwilling or unable to provide the expense of this education, I would like to see started at an early age, put in a sort of cycle course where their vocational leanings can be discovered. After a boy has found himself, or his vocational leaning has been discovered and has decided he would like to become a building mechanic, then the rudiments of these trades can and should be taught in the public schools. Brick-laying, carpentry, plumbing, steam-fitting, and the various other trades, can be taught advantageously in the public schools. The Public will demand that they be taught in the near future, but I want to go on record that you cannot make a Finished Artisan in the public school. You can teach him the use of his tools, mathematics, drawings, etc., so that when he comes to the Industrialist at the age of 16 or 18 he is able to earn as big pay as the boy who is driving a truck, or the poor, or semi-skilled, machine hand. To become a finished artisan requires knowledge, and the only place it can be acquired is at the building. This competition for the boys and the builders' inability to teach them at an economic wage, is one of the causes of the terrific scarcity of building mechanics.

Even though the builder feels that it is entirely possible to teach the rudiments of the trades in the public schools, utilizing such time as may be necessary for the seeding of cultural attainments, the elements in civic and community service, etc., yet when the boy appears for the periods set aside for his chosen trade, he should be in the hands of a practical teacher who has gained his experience on the building.

You, in your previous discussions in conventions, have worked out these problems very effectively. Coming back to the practical side of teaching a trade to the boy, you can teach the boy in the brick-laying trade, how to cut brick, how to lay out an arch, how to cut tile, how to lay up the various bonds, how to lay out his corners and lay out a building generally, so that when he comes to a building he is not ungainly—he knows something of what might be expected of him. A Big Thing to acquire in the building trades is also the moulding and shaping of the body and muscles. It is as necessary for the plasterer to have command of his feet as it is for him to acquire the wrist motion. It is as necessary for him to be able to balance the

hock as it is for his eye to watch that part of the work to which he is applying his skill. When a carpenter or marble-cutter is using a chisel, they will always watch the point of the tool and watch the reaction of the hammer blow at the chisel point, and not where the tool is receiving the hammer blow. It is necessary to train the eye, mind and muscle to act in unison, the eye to watch the reaction of the tool and not the hammer stroke. When the boys are young, this can be most advantageously accomplished. When we train a ball player, we do not wait until he is 20 years old; when we train a musician, we do not wait until he is 16 years old. Why should we wait to train the body and muscles of a boy who expects to make his living in the building trades. These are all things that can be taught in the public schools. They are Big Things; they are interesting, and they enable the youths to command a wage, when you dismiss them at 16 years of age, equal to the wage of those who enter the lives of truck drivers and machine hands, with prospects of great future opportunities, only limited to the extent of willingness and application of endowments.

I want to call your attention again to the fact that the periods not required for educational training can be used by the Academician for teaching and seeding the cultural and gentile pursuits.

Then, too, our mechanics know very little of the history of their trade and trade traditions. The building operations of today do not lend themselves to teach boys any of the glorious past in trade achievements. We cannot tell the boy that next to the implements of war and implements of agriculture, the implements with which he is making his living are the oldest known in the World's history. The building trades can point with pride to the existence of their art for at least six thousand years. They can point with pride to the monuments of the past, and they can be told that the old artificer, before the days of industrial enslavement and class consciousness, enjoyed a social standing equal to that of the professional man.

The practical teacher can develop in the boys a vocational and trade consciousness, trade pride and appreciation for fine workmanship. It can be pointed out to him that it is not sufficient to know enough of the trade to "just get by;" that it is unfair to his brother craftsmen to hold them down to a general level when the wage is based on the production and ability of the poorest workman. We know that a poor workman is a parasite on the good mechanic's ability. We can develop a trade consciousness in the building industries, and develop a set of craftsmen who not only have a Union, but also a Trade.

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

Insurance Company of North America PHILADELPHIA

write practically every form of insurance except life*

These Preserving People Preserve Their Concrete Floors with "ANTI-HYDRO"

The concrete floor in the basement of this building is constantly subjected to the severe conditions peculiar to this industry. Yet "ANTI-HYDRO" has so thoroughly and permanently hardened the concrete that it is unaffected by acids, oil, water and wear. "ANTI-HYDRO" is extremely easy and economical to use. Being a liquid, it mixes readily with the gauging water and through the concrete, insuring uniform strength and hardness to the concrete. It accelerates the set of cement without weakening it and so enriches it that much of the finishers' time is saved and overtime work is eliminated.

For 20 years "ANTI-HYDRO" has been the accepted standard. Results are always permanent and results are what count. Use it on your next job.

As The Editor Sees It

LOGIC ON DAY LABOR CONSTRUCTION BY STATE

The contractor of today has made many mistakes, but has paid for them with his own money. He has become a man of high character. The force that has had more to do with making him a sterling man has been that, he has had to start at the bottom and climb slowly, step by step, the hill of experience and success. Experience has taught him how to select his men and inspire them with their work until they have become a cog in his organization. Watch him on his job, as he seems to see everything—constantly alert. Why is this? Merely because his reputation is staked on two factors—good workmanship and the elimination of mistakes so as not to impair his financial standing. That is why he stands so high in the realm of efficiency. Through years of untiring effort, he has acquired an organization equipment necessary for his work, skill and financial responsibility.

Day Labor Is Costly

Now who is fast becoming his competitor? Is it the man of skill, of high character, financial responsibility, the man who, when he completes a piece of work, looks at it and sees there a monument to his name, and his ability as a builder? No! Emphatically no! He is generally a politician who asks that he be given the work by day labor. He is not

elected or appointed because of his ability and experience as a contractor. It is well known that he was elected to that office because he was a "good fellow," the voters were sorry for him so they gave him a job, or else it was because he was harmless. He has no organization, no equipment, and generally a limited knowledge of the construction business. Generally he has been a failure in his own business, for certainly, if successful, he would not be in a public office, and remember this, he does not use any of his own money in the construction project.

No contractor in his right mind would hire such a man for a sub-foremanship, let alone superintendent of his work.

Politics Creeps In

Another absurdity of day labor construction is that most of the workmen are tax payers and given these jobs because of this and perhaps to augment political prestige. They have had no experience in construction work, and as an illustration, a man in charge of some county work in Beadle County, So. Dakota, made the following statement to the writer: "I can't make any headway with the work because my men are all taxpayers and won't put any pep into the job, and I can't fire them very well."

Another county in So. Dakota sent eight men to take out an old culvert. They spent exactly one day at it. It

would have cost a So. Dakota contractor less than \$5.00 to have done this work.

The counties in Minnesota have learned their lesson early, and it is understood that there are only two counties left in that state, doing their own work.

The report of the United States Bureau of Public Roads in 1920 shows from a study of twenty California Highways, ten of which were done by contractors and ten by the State's forces, that the contract jobs exceeded the engineer's estimate by 39 per cent. while the day labor jobs exceeded the engineer's estimate by 193 per cent.

It is gratifying to add that the present California administration went into office under a pledge to stop this reckless waste and to carry on its public construction under public competition and with a firm contract protected by surety bonds.

The Gila Dam in Arizona was estimated to cost \$800,000. It was built by day labor, without change of plan, and actually cost nearly \$2,000,000 to complete.

The writer has made many attempts to procure from counties in South Dakota the unit cost of work done, but has been unsuccessful. Undoubtedly no cost keeping was attempted, nothing allowed for the purchase of equipment, nor for its depreciation, no consideration made for compensation, insurance, bookkeeping or the overhead charges of officials. It is safe to say that there is not a county

in South Dakota that can give an accurate cost on the spreading of a yard of gravel, the moving of a yard of dirt, or the laying of a yard of concrete.

Counties are using taxpayers' money in their work and the taxpayers are entitled to know what their costs are. County officials have no right to gamble with taxpayers' money whether it is day labor or by taking a contract.—*Bulletin, Associated Contractors of South Dakota.*

WE are in accord with the sentiment of the Corn Exchange in its recent article on "The Case of the Philadelphia Contractors." Certainly Philadelphia should be able to supply competent contractors to complete projects in Philadelphia. Why not show the Philadelphia Contractor a little courtesy by giving him a chance before crowding him off the list of invited bidders to place a New York or any foreign contractor thereon.

Says the *Corn Exchange*:

During the past year it is stated that as much as eighty million dollars' worth of contracting business has been given by distinctly Philadelphia corporations and institutions to contracting firms whose headquarters are outside our city. While it is not the desire or the thought of the Philadelphia general contractors to build a fence around the city, since they invite competition as the life of trade, that such institutions as a large hospital, a large insurance company, an electric plant and a large trust company building should award their construction work to firms outside the city, without competition from local general contractors, would seem to be a reasonable cause for complaint, and to create a situation that must be rectified if this important Philadelphia industry is to grow and the individual general contracting firms are to grow with it.

A condition arose recently where a charitable institution raised funds by popular subscriptions only, not in Philadelphia, but in only a section of Philadelphia, for the building of a large addition

to their plant, and there were eight bidders invited on this building by the committee, three of them practically "foreign" corporations, to the exclusion of local contracting concerns who had personal interest and were personally and financially able to handle the contract—an entirely unjustifiable situation—and these three "foreign" corporations were concerns of such a character that the work was entirely out of their line of activity, but were invited apparently only because the committee thought the contract too large for other than the four local contractors invited, or would need further financing than their funds at hand would permit. Should this be possible in a city of 2,000,000, the third city in the country, with possibly 100 general contracting firms needing business and support?

Many office and monumental buildings for local institutions throughout the city in the past year have been built by "foreign" corporations and many of them without local competition.

The answer to all this is that the general contractors of Philadelphia must organize and by their merit must have the support of the business interests and the commercial trade bodies, and these same interests must be made to realize they must render help and service to those from whom they get their growth and support.

There is an immense amount of work contemplated in the next few years within Philadelphia. Why can it not be handled in its entirety by local contractors on competitive basis? In other cities, particularly New York, it is practically impossible for a Philadelphia contractor to enter within twenty-five miles radius of the city; and although we have no desire to create such a barrier around Philadelphia, we only ask for consideration first, and then co-operation.

We'll write your advertising without charge. All we ask is that you pay for the space and provide our ad. man with the necessary selling pointers.

Bank, Medford, Burlington County, N. J. Architect, Thomas E. Ash, 1012 Walnut street, Philadelphia. Owners, Burlington County National Bank, Medford, N. J. Brick, 2 stories, 28x60 feet, slate roof, wood and linoleum floors, vapor heat, electric light, marble work. Contract awarded H. B. Miller, Edgewater Park, N. J. Electric, J. H. Anderson, Mt. Holly, N. J. Heating and plumbing, W. F. Smith, Medford, N. J. Concrete and cement, Medford Cement Co., Medford, N. J. Vault, York Safe & Lock Co., 1613 Chestnut street, Philadelphia.

Bank, Fifth and Market streets, Camden, N. J. Architects, Davis, 3rd, Dunlap & Barney, 1805 Walnut street, Philadelphia. Owners, Land Title Guaranty Co. of New Jersey, Mr. Halyburton, on premises. Brick, cut stone, steel, 2 stories and basement, 100x38 feet, slag roof, rubber and cement floors, plumbing, ornamental iron work, hollow metal and kalamein doors, rolled steel sash, tile, marble and terrazzo work, steam heat, electric light, bronze work. Contract awarded to Cramp & Co., Denckla Building, Philadelphia.

Residence and Garage, Woodbury, N. J. Architect, R. L. Goldberg, 10 South Eighth street, Philadelphia. Owner, George A. Eagen, care of architect. Frame, 2½ stories, 25x60 feet, 1 story, 20x24 feet, creosote-dipped shingle roof, oak floors, cement work, tile work, electric light, vapor vacuum heat. Contract awarded Neilson Carlson, care of architect.

Residence (alts.), Riverton, N. J. Architect, J. Fletcher Street, 1120 Locust street, Philadelphia. Owner, Lindley C. Robinson, Riverton, N. J. New sleeping porch, carpentry and mill work, painting and glazing, hardware, plastering. Contract awarded Louis F. Lowden, Riverton, N. J.

Boardwalk, Cedar avenue to Twenty-sixth avenue, Wildwood, N. J., \$123,167.68. Engineer, W. H. Boardman, 426 Walnut street, Philadelphia. Owners, City of Wildwood, Wildwood, N. J. Concrete and wood, 60 feet wide. Contract awarded F. W. Schwiers, Jr., Co., 90 West street, New York.

Manufacturing Building, Freehold, N. J. Owners, A. M. Karagheusian, Inc., on premises. Reinforced concrete and brick, 6 stories, 80x168 feet, slag roof, cement floors, steam heat, electric light, rolled steel sash. Contract awarded William Steele & Son, 219 North Broad street, Philadelphia, who are taking sub-bids.

Miscellaneous Construction News

School, Denton, Caroline County, Md. Architect, Theodore Wells Pietsch, American Building, Baltimore, Md. Owners, Board of Education, Denton, Md. Brick and steel, 2 stories and basement, 134x76 feet, slag roof, maple floors, metal lath, bond, ornamental iron work. Owners taking bids due March 5th.

Junior High School, New Rochelle, N. Y. Architects, Starrett & Van Vleck, 8 West Fortieth street, New York City. Owners, Board of Education, New Rochelle, N. Y. Brick, steel, cast stone, 3 stories and basement, 95x50 feet, wing 68x26 feet, 115x63 feet, 60x72 feet, 161x40 feet, Barrett's Specification roof, wood block, ornamental iron work, floor hardener, bond, rolled steel skylights, cement and maple floors, hollow tile, roof ventilators, waterproofing, hollow metal sash, tile, marble and terrazzo work, metal

lath, soapstone. Low bidders: N. H. Vought, Grand Central Terminal, New York, \$655,773; Mazulo Mezzula, Port Chester, New York, \$667,174.

Residence and Garage, Winston-Salem, N. C. Architects, Charles Barton Keen and Wallace, 338 South Smedley street, Philadelphia. Owner, B. S. Womble, Winston-Salem, N. C. Hollow tile and stucco, 2½ stories, 67x32 feet, garage, 2 stories, 22x25 feet (heating, plumbing, electric, tile and marble work reserved), Ludawici Celadon tile roof, oak and cement floors. Architects taking bids due March 14th.

Proposal

ADVERTISEMENT FOR THE CONSTRUCTION OF ADDITION TO PUBLIC SCHOOL NO. 3, AUDUBON, N. J.

Public notice is hereby given that sealed proposals for furnishing labor and materials to construct and furnish mechanical equipment for the addition to Public School No. 3 for Audubon, N. J., will be received by the chairman of the Property Committee of the Board of Education of Audubon, N. J., at School No. 1, Oak Street and Oakland avenue, Audubon, New Jersey, on Tuesday, March 17th, 1925, at eight o'clock P. M., at which time all proposals submitted will be opened and publicly read.

The work is as follows:

Four additional class rooms and connecting corridor. This building will be constructed of brick walls, concrete slab over corridor, with iron girders and wood joist floor construction with wood roof covered with built-up roofing, and contains approximately 96,664 cu. ft.

The building will be erected on the ground immediately in the rear of the present building which is located on Haviland avenue, Audubon, New Jersey.

Bids will be received for the following items: General Construction, Heating and Ventilating, Plumbing Work, Electrical Work.

Said proposals must be on blank forms provided for that purpose and must be closed in sealed envelopes endorsed "Proposals for Addition to Public School No. 3, Audubon, N. J.," and must state the branch of work for which proposals are submitted.

No bid will be considered unless accompanied by a certified check to the amount of five per cent. of the bid, binding the bidder to execute a contract if awarded to him. The terms of the proposal with surety required are fixed by the specifications, to which reference may be had. The right is served to reject any or all bids submitted, also to waive any informality in the same.

Copies of the drawings and specifications may be seen at the architect's office, and copies will be loaned to bidders by the architect on deposit with him of a certified check to his order for the sum of \$50.00. Upon return of drawings and specifications the check will be returned. These drawings and specifications may be obtained by application to Arnold H. Moses, Architect, Temple Building, Camden, N. J.

Dated February, 1925.

NO BUILDING SHORTAGE

SAYS G. L. MILLER

Practical Real Estate Financier Discusses Subject from a New Angle

Has the building shortage existing since the war been met by the great amount of new building carried forward in increasing volume each year and culminating in a total of more than \$5,000,-

000,000 in new structures erected in 1924? This is the question that all those interested in the building industry are asking today.

Mr. G. L. Miller, president of G. L. Miller & Co., Inc., whose house has financed hundreds of new building projects by first mortgage real estate bonds, who has made a survey of this subject recently, says:

"Every so often we see published tabulations of figures with reference to the extent of the building shortage in the United States, together with forecasts regarding the probable future extent of these shortages. Recently upon two successive days there appeared in two of the leading New York dailies, articles apparently based upon extensive study of building records, but directly at variance with each other."

In the first, it was estimated that the national shortage of building on January 1, 1920 was \$6,806,135,000. According to the method of computation used, this shortage was decreased from year to year, showing an estimated shortage on January 1, 1925, of only \$750,000,000.

The second tabulation showed a cumulative shortage of housing space of 271,000,000 square feet in 1913, and the figures indicated that this shortage was increased every year until 1924 when the total shortage was 1,420,000,000 square feet.

In explanation of these latter figures, it was pointed out that this is incorrect to estimate building shortage or surplus in terms of dollars, since building costs per square foot vary from year to year, and it is actual physical supply and demand which must be considered.

"With this contention most of us will agree," continued Mr. Miller. "But can we agree with the following statement, which I quote from the article referred to:

"In the last three years the country has been spending for new buildings an amount never approached before. But the building shortage instead of being relieved, is indicated by these figures to be growing steadily worse."

"We cannot trust arithmetic alone. The first survey referred to shows no short-

BELL PHONE, CAMDEN 3827 W

age to speak of: the second indicates a worse crisis than ever before. Can we ever ascertain the true facts of the situation? I do not believe it possible. Nor is it of practical importance that we do so," said Mr. Miller.

During the past three years there has been expended for new building in the United States, somewhere between \$14,000,000,000 and \$16,000,000,000, and the year 1924 has seen a larger amount expended for building than any previous year, a sum in excess of \$5,000,000,000.

The important question which now interests builders and those businesses dependent upon the building industry is: "Has the shortage which has admittedly existed since the war, ceased to effect building or when will its impulse dwindle off?"

"Of course, when there is an acute situation with reference to housing conditions, such as existed during the few months prior and immediately following the armistice," said Mr. Miller, "the whole world knows that there is a building and housing shortage. When whole families are being taken care of in armories and public parks, it takes no theorizing to know that a shortage exists.

"However, in times like the present it is more difficult to tell whether there is an actual shortage and to estimate exactly its extent, for the reason that so many other factors enter into the problem.

"Rental levels and construction costs, ease of securing money, general prosperity and high wages,—all these enter into the problem of how many additional buildings can be filled at any given time.

"The factors of supply and demand are always active. There is always demand for better accommodations when they can be secured at the same figure as has been paid for those of inferior quality, and wherever a new building is opened in a locality, it usually results in an exodus from older structures.

"When rental levels are lowered, there is a gradual but constant expansion caused by people moving from small apartments to those with more rooms and thus a more or less constant balance is at all times effected by the operations of the law of supply and demand.

"I see no possibility of any marked reduction in material or labor costs for some time to come," continued Mr. Miller, "neither do I look for any reduction of rentals in the case of well situated buildings properly constructed, according to modern standards.

"In fact, the entire question of shortage concerns us not nearly so much as the actual conditions in a particular locality, and the results which may reasonably be expected from an individual building. In other words, each project must be taken up and considered by it-

self and the probable future course as to rentals and occupancy must be charted with the greatest possible degree of accuracy.

"We have one case in mind where a building financed by us and nearing completion is about 80% rented, whereas another larger and more pretentious building within a few blocks has been finished for several weeks, and is now standing almost totally vacant.

"This does not indicate a question either of shortage or of over-supply of office space. It merely means that under actual present conditions, the factors of location, plan of the building and scale of rentals worked out in one case as though there were a shortage and, in the other, as though there were an over-supply.

"So it goes throughout the entire building field. It is much more the problem of care and good judgment than of either shortage or surplus," said Mr. Miller.

WOODS AND HOW TO USE THEM

The Wood for Interior Finish

Wood for interior finish must always be given proper care at every stage of the work, if the finished results are to be satisfactory. Finishing lumber, when delivered on the job, is a fine manufactured product. It has been skillfully kiln-dried, the surplus moisture has been expelled under such pressure that the wood is not warped, and the surface has been put into proper condition for working into trim and other finish. If such lumber is delivered in wet weather to an unfinished house where the plaster is not yet dry; if it is piled in such a way as to bend and warp the boards; if it is tramped over or given rough usage, then much of the labor done in the factory which has represented such a large part of the cost, is wasted and lost. The laying of the hardwood floor should be absolutely the last piece of work done, so that after it has been waxed or varnished no foot should step into the room until the furniture is brought, when the floor should be carefully protected while that is being put in place.

Woodwork which is to be finished should be smooth, clean and dry before commencing the work. Any scratches or cuts across the grain should be obliterated. Each coat of finish should be sandpapered with fine sandpaper before the succeeding coat is applied. The finish may be left in the gloss or it may be rubbed to a dull finish, and in very fine

it may then be polished. Since the two latter processes require a great deal of expert labor, the manufacturers have prepared products which give a similar finish without the rubbing and polishing and, especially in simpler work, they give excellent results. The most beautiful finish that a piece of wood can have is

that given by constant usage on rubbing with the hand. The finest polish is finished with hand rubbing and only approaches the fine ancient woodwork over which the hands of passing generations have been rubbed.

The finish of a room may be the same wood as the furniture or it may tone with it in an agreeable way. Mahogany furniture may be used with ivory enamel or with some soft toned gray stain. In this way birch, gumwood, or even oak, may be used with mahogany furniture. Oak takes a gray stain particularly well. Birch or gumwood may be given a mahogany stain, but this has the disadvantage of a more or less palpable imitation, and the present tendency is to treat wood in its own manner rather than to give it the semblance of some other wood.

When wood is to be stained that is the first process in the operation. The stain should be applied directly to the surface of the wood, whether the wood is open or close grained.

The same stain will not produce just the same color on all woods. There will be a variation, brought about by the color tone and absorptive quality of the wood. Soft woods absorb more stain than hard, close grained wood, so that the color effects would be darker in tone. Then again hard woods with pronounced grain or makings will take stain in a different manner from woods showing little or no grain. The reason for this is that the stain penetrates more deeply in the open or spongy portions of the wood, while the harder parts of the wood—the grain or markings—are much less absorbent, and consequently appear lighter in color, emphasizing the grain, and changing the color effect.

Either water, oil, or spirit stains can be used for wood staining operations.

Water stains produce bright, transparent color effects, but require careful handling to avoid raising the grain of the wood. If these stains are well rubbed into the wood with a bunch of cheesecloth, the grain of the wood will not be raised as the cloth will absorb the surplus moisture and at the same time make an even color tone. If, however, water stains are applied and allowed to soak into the wood without wiping, the excess moisture will naturally cause the wood to swell and raise the grain.

Spirit stains make brilliant color effects, and strike deeply into the wood. They produce practically the same appearance on the wood as water stains.

Neither the beauty of the grain in the wood nor the color are taken into account in enameled woodwork. The only attempt is to obtain a perfect surface in a beautiful color or tone; a surface which shall be hard enough that it is not easily marred or dented in usage, which yet can be kept immaculately clean.—*Keith's Magazine.*

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

The Mark

of Greater Efficiency

When you install hot water systems bearing this trade-mark — you install systems that are 84½% efficient.

**BRYANT AUTOMATIC
Hot Water
STORAGE SYSTEMS**

Automatically controlled—they furnish a dependable supply of hot water of uniform temperature. Bryant Hot Water Storage Systems embody: *Capacity* to meet demands in excess of maximum requirements. Ability to maintain initial pressure until all faucets are turned off. *Dependability* based on simple rugged construction.

The office listed below will be glad to tell you more about them.

Residence of U. S. EPPERSON
Country Club District, Kansas City, Mo.

Heated by a No. S 8-40 Novelty Carburetor Boiler. Architect: Horace La Pierre, Kansas City. Heating Contractor: E. K. Campbell Heating Co., Kansas City. Vapor System—Direct Radiation, 3715 Sq. Ft.

Another Tribute—

In magnificence and scope the Country Club District of Kansas City, Mo., recognizes no peer. The outstanding residence of this famous section is the home of U. S. Epperson, Esq. (Cost over \$1,500,000.)

The fact that a Novelty Carburetor Boiler was selected for this architectural achievement is another tribute to the prestige and efficiency of this newest patent heating boiler, which has been installed in a notable array of fine buildings all over the nation.

Cheap oil is used as fuel. From the first—three years ago—the Epperson home has been cozy and warm as well as architecturally impressive.

Burns any kind of fuel without smoke and with exceptional freedom from heat losses. The carburetor chambers on the rear of the boiler automatically mix all smoke and carbon, ordinarily wasted, with oxygen from the air—and burn them. The air enters top and bottom slots of the carburetors, as shown in the picture. *No adjustment of air intake is necessary.* Rate of combustion determines amount of air required.

Write for illustrated and descriptive booklet. There are facts in it you would like to have at your finger tips.

A cast-iron sectional side-feed, up-draft, low waterline, smokeless boiler. Easy to install, simple to operate. Exceptionally durable. Saves space.

Partial list of other important installations:

Brick, 2 stories, 17 feet 6 inchesx55 feet 6 inches, 14x44 feet, hot air heat, slag roof, pine floors, electric light. Contract awarded John Onderski, 1825 Tioga street, Camden, N. J.

The man with an order to place doesn't hunt you up in the city directory these days. He hasn't the time. If he can't find you in your trade magazine he can and does find somebody else, and that somebody else books the order.

Stone, 4 stories and basement, 64x185 feet (electric, plumbing, heating and tile work), slate roof, hardwood floors. Contract awarded J. A. Gardner, Charlotte, N. C.

Just remember this: Give out courtesy, kindness, patience and good-will, and you'll get them all back with compound interest. The men who deserve to rank in Class A do not chew the lint and fuss about the small misfits of life. To take what comes and forget the rest is wisdom. Let Braggo give the janitor the call, and the Hall Boys have it out with the Ashbox Inspector—you can't afford to soil your soul with small scraps. Fight on a big scale, or not at all. The folks who have trouble with ushers are always looking for trouble—and find it. Smile, old boy, smile!

Proposal

ADVERTISEMENT FOR THE CONSTRUCTION OF ADDITION TO PUBLIC SCHOOL NO. 3, AUDUBON, N. J.

Public notice is hereby given that sealed proposals for furnishing labor and materials to construct and furnish mechanical equipment for the addition to Public School No. 3 for Audubon, N. J., will be received by the chairman of the Property Committee of the Board of Education of Audubon, N. J., at School No. 1, Oak Street and Oakland avenue, Audubon, New Jersey, on Tuesday, March 17th, 1925, at eight o'clock P. M., at which time all proposals submitted will be opened and publicly read.

The work is as follows:

Four additional class rooms and connecting corridor. This building will be constructed of brick walls, concrete slab over corridor, with iron girders and wood joist floor construction with wood roof covered with built-up roofing, and contains approximately 96,664 cu. ft.

The building will be erected on the ground immediately in the rear of the present building which is located on Haviland avenue, Audubon, New Jersey.

Bids will be received for the following items: **General Construction, Heating and Ventilating, Plumbing Work, Electrical Work.**

Said proposals must be on blank forms provided for that purpose and must be closed in sealed envelopes endorsed "Proposals for Addition to Public School No. 3, Audubon, N. J.," and must state the branch of work for which proposals are submitted.

No bid will be considered unless accompanied by a certified check to the amount of five per cent. of the bid, binding the bidder to execute a contract if awarded to him. The terms of the proposal with surety required are fixed by the specifications, to which reference may be had. The right is served to reject any or all bids submitted, also to waive any informality in the same.

Copies of the drawings and specifications may be seen at the architect's office, and copies will be loaned to bidders by the architect on deposit with him of a certified check to his order for the sum of \$50.00. Upon return of drawings and specifications the check will be returned. These drawings and specifications may be obtained by application to Arnold H. Moses, Architect, Temple Building, Camden, N. J.

Dated February, 1925.

SPECIFICATIONS FOR ASPHALT PREPARED ROOFING

Specifications for asphalt prepared roofing, based on the results of investigations conducted by the Bureau of Standards, Department of Commerce, have been adopted by the Federal Specifications Board to serve as U. S. Government Master Specifications for the purchase of this material.

Two weights of this roofing have been covered by the specifications, medium and heavy weight, averaging 45 and 55 pounds respectively per 108 square feet of area. The detailed requirements specified cov-

er appearance, maximum and minimum weight, pliability, and behavior of the roofing on heating. Requirements for the dry felt from which the roofing is to be prepared are also given and correspond to Nos. 48 and 60 respectively for the two weights. Specifications for the nails and lap cement used in applying the roofing are also given together with methods for its inspection, sampling, and testing.

The investigations on which these specifications are based have been in progress at the Bureau of Standards for four years, and have covered all types of bituminous roofing. They have been made in co-operation with the manufacturers and large consumers of the materials, and with government departments interested in them.

These specifications are given in Circular 192 of the Bureau of Standards. Copies may be obtained from the Superintendent of Documents, Government Printing Office, Washington, D. C. The price is 5 cents, each.

How to raise the standard of American homes built in the future, what facts on home building should the public have, and how own your home expositions can best be developed as mediums for encouraging residence construction are among the subjects to be taken up by a convention of the construction and allied interests called by the National Association of Real Estate Boards in connection with the Chicago Fifth Annual "Own Your Home" Exposition to be held in the Coliseum the last week in March.

Officials of more than forty national allied trade organizations and associations that a year ago approved the plan of licensing all such expositions and building shows by the National Association of Real Estate Boards, have been invited to attend this convention, the first of its kind to be ever held. The Committees of Administration, the Advisory Committees, and the Exhibit Committees of the New York, Philadelphia and Buffalo "Own Your Home" Expositions, conducted under the same plan as the Chicago Exposition, have also been invited to participate. These committees are composed of prominent members of the local real estate boards and of the various trades, and in most cases the chairmen are presidents of the local chapters of their respective trade organizations.

Recommendations on how to improve the efficiency and lower the cost of American homes built in the future, and how to best educate the public, as well as contractors and builders on correct construction practices and the uses of standard and new approved materials, entirely aside from the Expositions, coming from

such a celebrated group will, undoubtedly, have far reaching results. Never before in the history of business have great national organizations assembled for a common purpose according to Bartholomew O'Toole, Chairman of the "Own Your Home" Division of the National Association of Real Estate Boards, and we now look for the day when flimsy construction, bad planning, and the woe-ful trail of enormous waste and losses in the erection of homes will be a thing of the past.

The Convention has been called at the time of the Chicago Exposition in order that these delegates may see how it has been developed with the support of these national organizations. The first day of the convention has been set aside for an inspection and analysis of the Exposition, and preliminary conferences will be held to determine how each profession and trade can be visualized in an even more constructive manner at such expositions held in the future.

Secretary of Commerce Herbert Hoover will probably be a guest of the Convention, Charles G. Edwards, President of the National Association of Real Estate Boards will preside, and Chicago officials will assist in receiving the delegates.

The Presidents of the following organizations are included among those to whom invitations have been issued: The American Institute of Architects, The American Institute of Landscape Architects, The American Society of Civil Engineers, The American Society of Heating and Ventilating Engineers, The National Association of Mutual Savings Banks, The United States League of Local Building and Loan Associations, The Wall Paper Manufacturers' Association, The National Alliance of Furniture Manufacturers, The Society for Electrical Development, The National Council of Lighting Fixture Manufacturers, The American Gas Association, The Portland Cement Association, The Common Brick Manufacturers' Association, The American Face Brick Association, The Hollow Building Tile Manufacturers' Association, The Prepared Roofing Association, The National Lumber Manufacturers' Association, The National Wholesale Lumber Dealers' Association, The National Retail Lumber Dealers' Association, The National Paint, Oil and Varnish Association, The Associated Metal Lath Manufacturers, The Associated Tile Manufacturers, The National Association of Master Plumbers, The Heating and Piping Contractors' National Association, The Warm Air and Ventilating Association, The American Fuel Oil Burner Manufacturers' Associations, The American Association of Nurserymen, and The Society of American Florists and Ornamental Horticulturists.

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

Insurance Company of North America

Indemnity Insurance Company of North America write practically every form of insurance except life

This Warehouse is Always Dry—It's Waterproofed with "ANTI-HYDRO"

Insurance companies give a lower rate to warehouses with waterproof floors than those without them. By using "ANTI-HYDRO" you can guarantee waterproof floors and the saving in insurance premiums for your clients, and at the same time give them absolutely hard, dustproof floors.

"ANTI-HYDRO" is a liquid integral compound, extremely easy to use. Any unskilled laborer can mix it with the gauging water. One troweling is usually sufficient for a perfect finish when "ANTI-HYDRO" is mixed with the concrete. It also accelerates the set of cement, eliminating over-time work.

Twenty years of continuous use assure you of complete satisfaction from every "ANTI-HYDRO" installation. Use it on your next job.

As The Editor Sees It

IN accordance with the recent decision of the various Exhibit Committees of the National "Own Your Home" Expositions to teach the public good construction practices and the proper uses of certain materials and equipment, houses *in the process of construction* will be featured at the Expositions to be held this Spring in Chicago, New York City, Philadelphia and Buffalo.

The four houses selected for these unique exhibits, as expert examples of small house designs, were selected only after long deliberation on the part of the Exposition Architectural and Building Materials Committees and the examination of hundreds of exceptional architectural plans. These committees considered the adaptability of the designs for the demonstrations planned as well as their architectural charm and the probable material and labor costs of building them.

The front elevations will be completely reproduced on the floor of each exposition, showing part of the roof and several windows. These elevations will be set in old fashioned English rose gardens and give the appearance of finished houses, and the rest of the structures will be shown under the process of construction, presenting striking lessons in how foundations should be laid, walls built and plumbing installed. These exhibits will include side walls showing the use of various materials, cross section displays, and exhibits of products in their

proper relation to other materials used in the modern home.

Such displays will provide visitors with a comprehensive picture of correct construction, educate them in the use of standard materials and products and finally convince them that the properly planned and well built house will have considerably less upkeep and depreciation than the house that is poorly planned and cheaply built.

This appeal to the public to insist that their contractors and builders observe the methods and use the materials exhibited on the Exposition floors will, in the opinion of prominent representatives of the construction and allied trades, do much to raise the standard of American homes built in the future. This campaign is in accordance with the new Code of Ethics prepared by the Exposition management, assisted by the forty national allied professional and trade organizations, city planning and other experts who support the Expositions. This Code covers the standards to be maintained in visualizing the various professions and trades participating in the Expositions and is to be used in the conduct and further development of them.

A four room house designed for the Architects' Small House Service Bureau has been selected for the Chicago Exposition by C. Herrick Hammond, First Vice President of the Illinois Chapter of the American Institute of Architects. The

facade will be built of pink "Elastica" stucco on concrete block with green-blue shutters and a tile roof. The side entrance to the porch, the broken projection of the roof, the casement windows and the old English chimney pots give a distinctive appearance to this design.

Although the floor plan provides for only four rooms, there is a dining alcove that adds space to the living room. No doubt the small family living in this house would use the breakfast nook a great deal, and therefore, have the use of an unusually large living room. The two bedrooms are so arranged as to be a private suit, shut off from the balance of the house. It is possible to enter the kitchen from either one of the bedrooms without going through the living room. An attic is available through a scuttle placed in the rear bedroom closet.

The Building Materials Committee of which Gardner C. Coughlen, American Specification Institute is Chairman; the Concrete House and Cement Products Committee of which Henry Buchholz is chairman; the Heating and Ventilating Committee of which Homer D. Linn, President of the Illinois Chapter of the American Society of Heating and Ventilating Engineers is chairman; the Sanitation Committee of which Joseph W. Cannon, President of the Plumbing Contractors' Association of Chicago, is Chairman, and the Landscape and Garden Committee of which Ralph R. Root, Root

PHILADELPHIA

and Hollister, is chairman, are included among the Chicago Exposition Committees directly in charge of this Exhibit.

A five room house has been designed for the New York Exposition by Arthur C. Holden, member of the American Institute of Architects and Chairman of the Architectural Committee. Like the Chicago house, its long low lines are particularly adapted to the plans of the landscape and Garden Committee to reproduce an old fashioned English rose garden. The exterior finish of the elevation for this house is to be portland cement stucco on concrete block and the problem of the small home builder has been carefully studied in achieving the floor plan for this design. A vestibule with two closets for coats, is at the entrance. There are windows on three sides of the living room, and a large fireplace in the middle of the interior wall. The three French casement windows open out upon the covered porch which is paved in brick. The dining room, adjoining the living room, also has a fireplace, a feature greatly desired by the modern home owner. The kitchen, with its own rear entrance, refrigerator and cellar stairway, is convenient and compact. The master's bedroom has a large closet and adjoins the bathroom. There is also a second smaller bedroom.

In New York also the other Exhibit Committees interested in house construction are supervising the assembling of the exhibits for the display of this house. Colonel Roger D. Black is Chairman of the Building Materials Committee; B. H. Wait, Portland Cement Association, is Chairman of the Concrete House and Cement Products Committee; William J. Olvany, President New York Chapter American Society of Heating and Ventilating Engineers is chairman of the Heating and Ventilating Committee; and David Deigan, Ex-President Master Plumbers' Association, is Chairman of the Sanitation Committee.

In Philadelphia where the building situation is different from in the other cities a twin house has been selected by

the Architectural Committee of which James F. Talbott, member of the American Institute of Architects is Chairman. It will be pointed out to Exposition visitors that this house as an excellent example of the twin house and especially adapted for building in and near Philadelphia is a higher grade house and more to be desired than the solid row type prevalent in that city. The wood lattices on the porch and on the side openings into the small garden gives this house more individuality than in the usual twin house design.

As in the other cities the elevation will be of Portland cement stucco on concrete building block featuring the use of concrete block in party wall construction.

Space in the floor plan of this house has been utilized to the utmost. On the first floor there is a vestibule and small hall leading into a good sized living room and dining room. The living room is provided with a fireplace and built in bookcases and opens on a porch and garden. The placing of the porch, (which will have a concrete tile floor,) at the side of the house gives a desirable privacy. There is a large bedroom and two smaller ones and bathroom on the second floor and two additional bedrooms and bathroom on the third floor, so this house would accommodate a fairly large family.

Emile G. Perrot is Chairman of the Philadelphia Exposition Building Materials Committee directly in charge of this display and the other committees assisting include: The Concrete House and Cement Products Committee of which L. N. Whitcraft, Portland Cement Association is Chairman; The Heating and Ventilating Committee of which R. C. Bolinger, Fowler & Wolf Mfg. Company is Chairman, and the Landscape Committee of which Thomas W. Sears, American Institute of Landscape Architects is Chairman.

The three members of the Buffalo Exposition Architectural Committee have collaborated in achieving the design for

(Continued from page 164)

the Buffalo house. Frederick C. Backus, American Institute of Architects, is Chairman of this Committee and William C. Lurkey, Bacon & Lurkey, and Aaron Riley Merritt, are the other members.

The partial construction of this house also will be of portland cement stucco on concrete building block with a tile roof. The architects have provided for an unusual number of windows in this design that add to its exterior charm. The sloping line of the roof and the way in which it fits snugly over the house, gives this plan a cozy appearance.

In Buffalo also the other Exhibit Committees are taking an active part in planning the set up of exhibits for this house. Thomas W. Barrally, member of the American Society of Civil Engineers is Chairman of the Building Materials Committee; Walter H. Jones, President of the Federal Concrete Company, Inc., is Chairman of the Concrete House and Cement Products Committee and George E. McClure, George W. McClure & Son, is Chairman of the Landscape and Garden Committee.

English rose gardens are to be featured as settings for all the houses.

The dates of the four licensed "Own Your Home" Expositions have been coordinated so national manufacturers may prepare one exhibit for travel from city to city. The Chicago Fifth Annual Own Your Home Exposition will be held in the Coliseum March 21st to 26th; The New York Seventh Annual Exposition will be held in the 69th Regiment Armory from April 18th to 25th; the Philadelphia First Annual Exposition will be held in the Commercial Museum from May 9 to 16, and the

Buffalo First Annual Exposition will be held in the Broadway Auditorium, May 30th to June 5th. All of the Expositions are under the auspices of the local real estate boards in addition to being licensed by the National Association of Real Estate Boards, though no more space is allotted to real estate than to any other division.

THE RECOGNITION OF A GOOD WORKMAN

Years of constant work, and innumerable tests have revolutionized our methods of construction. Iron and steel in their many forms have, to a great extent replaced other materials. Yet back of it all is the human element, the craftsman, the man who executes the ideas of the designer. Without him, plans are at best, but theories.

Practically all work is now done according to Standard Specifications yet specifications are always based on the minimum, the least that will be accepted from an ordinary workman. There is a vast gulf between the work of such a workman and the handiwork of a master craftsman who knows more than books can teach him. He is the man who takes pride in his work, who realizes that it can be made a work of art, in the self same way, as a painting or a piece of sculpture.

These men who know their materials and their tools are the producers of all our better work. Yet seldom do they receive personal recognition, and it is this lack of recognition that is causing much of our construction work to come up only to the letter of the specifications.

There is a decided need for a change in our attitude towards these craftsmen. Not in an adjustment of working conditions but in the individual recognition of their efforts so that they may be spurred on to win higher achievements.

It is only by this method that we may progress onward and upward towards the standards set by the old masters of the past.

The Architect who praises the good work of a mechanic is placing credit where credit is due, and is gaining for himself far more than he is giving.

Don't crowd your space, Mr. Advertiser. Better play up one selling point at a time than to try to get everything into one ad. and kill every possible chance for display. An ad. should stand out. It should be easily read. It should draw the attention of the reader. A carload of detail can't be crowded into a few inches of space and still retain the quality of sticking out as all good advertising should.

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

Residence of U. S. EPPERSON
Country Club District, Kansas City, Mo.

Heated by a No. S 8-40 Novelty Carburetor Boiler. Architect: Horace La Pierre, Kansas City. Heating Contractor: E. K. Campbell Heating Co., Kansas City. Vapor System—Direct Radiation, 3715 Sq. Ft.

A cast-iron sectional side-feed, up-draft, low waterline, smokeless boiler. Easy to install, simple to operate. Exceptionally durable. Saves space.

Another Tribute—

In magnificence and scope the Country Club District of Kansas City, Mo., recognizes no peer. The outstanding residence of this famous section is the home of U. S. Epperson, Esq. (Cost over \$1,500,000.)

The fact that a Novelty Carburetor Boiler was selected for this architectural achievement is another tribute to the prestige and efficiency of this newest patent heating boiler, which has been installed in a notable array of fine buildings all over the nation.

Cheap oil is used as fuel. From the first—three years ago—the Epperson home has been cozy and warm as well as architecturally impressive.

Burns any kind of fuel without smoke and with exceptional freedom from heat losses. The carburetor chambers on the rear of the boiler automatically mix all smoke and carbon, ordinarily wasted, with oxygen from the air—and burn them. The air enters top and bottom slots of the carburetors, as shown in the picture. *No adjustment of air intake is necessary.* Rate of combustion determines amount of air required.

Write for illustrated and descriptive booklet. There are facts in it you would like to have at your finger tips.

Just remember this: Give out courtesy, kindness, patience and good-will, and you'll get them all back with compound interest. The men who deserve to rank in Class A do not chew the lint and fuss about the small misfits of life. To take what comes and forget the rest is wisdom. Let Braggo give the janitor the call, and the Hall Boys have it out with the Ashbox Inspector—you can't afford to soil your soil with small scraps. Fight on a big scale, or not at all. The folks who have trouble with ushers are always looking for trouble—and find it. Smile, old boy, smile!

WE ASK YOU

Isn't it funny?
THAT A MAN WHO CONSIDERS
HIMSELF A BUSINESS MAN
Will get up in the morning
From an advertised mattress,
And put on advertised underwear,
Advertised hose, shirt, collar, tie and shoes.
Seat himself at a table and
Eat advertised breakfast food,
Drink advertised coffee or substitute,
Put on an advertised hat,
Light an advertised cigar,
Go to his place of business and
TURN DOWN ADVERTISING ON THE
GROUND THAT ADVERTISING DOESN'T
PAY!

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

Insurance Company of North America

PHILADELPHIA

and the

Indemnity Insurance Company of North America write practically every form of insurance except life

This Warehouse is Always Dry—It's Waterproofed with "ANTI-HYDRO"

Insurance companies give a lower rate to warehouses with waterproof floors than those without them. By using "ANTI-HYDRO" you can guarantee waterproof floors and the saving in insurance premiums for your clients, and at the same time give them absolutely hard, dustproof floors.

"ANTI-HYDRO" is a liquid integral compound, extremely easy to use. Any unskilled laborer can mix it with the gauging water. One troweling is usually sufficient for a perfect finish when "ANTI-HYDRO" is mixed with the concrete. It also accelerates the set of cement, eliminating over-time work.

Twenty years of continuous use assure you of complete satisfaction from every "ANTI-HYDRO" installation. Use it on your next job.

Curtis, Sixth and Chestnut streets, Philadelphia. Stone, steel, concrete brick, 18 stories, 150x170 feet. Contract awarded Thompson Starrett Co., 49 Wall street, New York City. Plans in progress.

It is surely an injustice to your workmen as well as a source of loss to yourself to supply poor tools in your shop equipment. No man can do anything approaching good work with tools that take the edge off enthusiasm. In shop management, as in most things, details are the whole cloth. Tools are like men. They do good work or they do not, according to the character which they possess. Character in tools is a matter of good materials, expert making and correct design.

All advertising pays—even that which is poorly constructed. A bad ad. is better than no ad. at all. It is worth all that it costs in the competitive world of the present day, merely to keep one's name where the possible buyer cannot help seeing it. To be out of sight in the commercial world is to be out of mind.

Men are walking by and around people that want to buy from them, and do not know it.

The DAILY BUILDING NEWS will tell you who wants to buy your products.

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

Why Are Cast Iron Boiler Ratings Increased ???

Boiler ratings continue to increase. First one manufacturer and then another raises them. It is no wonder that users of cast iron heating boilers are befuddled for there are so many changes. But, why should this constant change be taking place?

Boiler ratings are increased mainly because the manufacturer finds that under certain ideal conditions, his boiler will do more work. But do you know what these conditions are? Do you know whether the building which you are considering has conditions resembling those in any manner? You do not; because manufacturers have not told you what they are.

Because of this confusion, the Abram Cox Stove Company have abandoned boiler ratings in general. In place of them, we offer the Novelty Boiler Handbook which tells just what each Novelty Boiler will do under various conditions governing each installation of steam, water, or vapor heating. The net radiation that each boiler will carry under these conditions is given there.

Every item in the Novelty Handbook is fully explained. Nothing is left to chance. You can tell just what each Novelty Boiler will do under the conditions governing your job.

Write today for the Novelty Handbook showing the Novelty Boiler Selection-Plan. Don't select any more boilers by chance.

Louis S. DeLone, Business Manager.

Sworn and subscribed before me this 18th day of March, 1925.

H. A. Lang, Notary Public.

(My commission expires March 2, 1929.)

An old legend tells of a magician's vase; the magician could get out of it only that which he put in. Advertising is just that. If you don't get into it the "kick" of salesmanship it is going to miss by just that much the pulling power it ought to have.

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

"ANTI-HYDRO" Protects This Stucco House Against Wear and Weather

Moisture or frost cannot enter the concrete and crazing or map-cracking have been entirely eliminated, simply by mixing "ANTI-HYDRO" with the gauging water of the cement and sand mortar.

"ANTI-HYDRO" permanently waterproofs and hardens stucco in one operation. It makes portland cement bond securely to tile, brick, or concrete. It may be used with pure white cement or any dry mortar color without affecting the color.

Try "ANTI-HYDRO" on your next job.
Any unskilled workman can use it.

As The Editor Sees It

Tendencies in Building Design

"Reprinted by special permission from FACTORY, the Magazine of Management"

Time was when "new buildings for old" proved to be merely an enticing phrase to tempt prosperous manufacturers. But great strides in lowering production costs have resulted from the planning by works engineers and consultants in building design. Some of the outstanding current developments are reviewed here.

Outlined here are some tendencies in modern factory design as seen by F. A. Fairbrother, of Albert Kahn, Incorporated, after wide experience in industrial building design generally and notably in the construction of automobile factories

IN recent years or even months, new tendencies have become apparent in the factory building situation. Granted sufficient room, both for present requirements and proper reserve for future expansion, it will be found that there has been a notable trend toward one-story buildings, occupying on the one hand, more ground, to be sure, but on the other hand, offering many and decided advantages.

Little imagination is required to picture the features favoring single-story buildings, so it should suffice to mention abundant light, ventilation, easy access, elimination of elevators and stairs, and the

corresponding favorable conditions for the use of efficient conveying systems.

It will have to be borne in mind that limiting conditions obtain in all matters of this sort. It will be found that the cost of one-story buildings is greater per square foot of available floor area than multiple-story structures. This factor must be weighed and its potency considered carefully in relation to cost of manufacture.

I believe it will be found, still granting sufficient ground area available, and with all regard for the character of the product, that small parts or relatively light manufacturing can be carried on more cheaply in multiple-story buildings, but for quantity production of large or heavy parts the single-story building will offer many advantages.

An outstanding example of the trend toward single-story buildings is seen in the recent group of single story assembly buildings being erected under our direc-

tion in various parts of the country for the Ford Motor Company. To picture this tendency more clearly it must be borne in mind that this company erected, some 10 years ago, a country-wide group of multiple-story service and assembly buildings.

Another example much to the point is the one-story addition to the Jewett plant of the Paige-Detroit Motor Car Company. This group was originally planned some five years ago and consisted of a group of multiple-story buildings with covered courts between, roofed over at the second-floor level. One of the courts and a one-story portion of one of the proposed multi-story concrete buildings was erected. Between the time of the construction of the first unit and the erection of the one-story addition noted above, the trend toward the single-story building had done its work and the multi-story grouping was abandoned. While it is possible that some multiple-story

buildings may still be erected at this plant for special purposes, the tendency toward the single-story building is strikingly evident.

H. K. Ferguson, President, The H. K. Ferguson Company, says that on the part of the manufacturer, the trend is toward a survey of actual building necessities before going ahead. Then he lists and comments on the five phases of the problem.

IN general, the trend of industrial construction is toward a careful survey of the actual necessities of the business requiring legitimate expansion, with the fundamental problems to be settled as ranging themselves about as follows:

1. If an entirely new plant is to be considered, are there conditions in connection with the delivery of raw materials or finished product, for access to customers' markets, or labor supply, which require an inside location on an expensive property, and therefore make it advisable to build a multi-story building in order to properly distribute the high cost of the property over a large amount of floor space?

(a) If so, can the buildings be arranged so as to locate heavy machinery, or other heavy floor loads such as stocks of raw materials or finished product, on the ground floor, with other departments with lighter floor loads in upper stories? Also, can the departments be divided approximately according to the areas available in the separate stories so as to avoid complication in the problems of administration and supervision.

2. Is the business of a character which requires a large amount of sidetrack for delivery of raw materials, or removal of finished product, or large areas of yard room, or is there a large amount of heavy machinery which requires location on a ground floor, or is the product so heavy that vertical transportation is difficult and expensive in comparison with lateral transportation by truck or crane? Also, is a large amount of evenly distributed daylight or overhead ventilation necessary or advisable, and will the problem of administration and supervision be materially simplified by locating the entire plant, or most of it, on one level? If so, it is likely that an outlying location will prove both advantageous and desirable.

A notable instance of a corporation which has lately changed from multi-story to single-story design for branch plants, is the Ford Motor Company, which is now developing large properties in the outlying districts of our cities in the single-story type of assembly plant.

3. When the ideal plant development plan has been worked out, and a property found which is reasonably suited for the purposes required, does any of the floor space needed lend itself to the so-called standard types of construction, as follows:

(a) Are there any warehouses or storage buildings where the possibility of a considerable amount of heat in the summer, or difficulty of keeping warm in the winter, will not be objectionable? If so, the sheet-metal types or semiportable, or unit types of standard buildings should be considered.

(b) Are there any considerable quantities of floor space required with large unobstructed areas, without columns, with uniform lighting with the possibility of needing overhead supports for shafting, and with excellent ventilation? Also, is quick delivery of the completed structure at moderate cost and practical universality of usefulness likely to be of advantage, particularly in single-story types? If so, it is well to consider the heavier types of standard factories as designed and built by several substantial industrial building concerns.

(c) Is there a possibility that parts of the sheet-metal types of buildings, or of the heavier types of standard factories, can be adapted in so-called semi-standard designs, to secure quick delivery and low cost?

4. In general, there is a very marked tendency toward the centering of responsibility for a substantial industrial development, either as an addition to an existing plant, or in the construction of an altogether new factory, to one organization which will plan, construct, and equip the factory complete, or do such part of the work as the owner does not wish to do with his own forces.

The immense increase in demand upon the time of the successful factory executive is making it necessary for him to place his design and construction business simply and quickly with responsible concerns upon whom he can depend absolutely for guarantees of price, delivery, and quality, without haggling at the outset and without argument during the progress of the work.

Such a bargain contemplates site selection, transportation development, the layout of buildings and equipment, using standard or special buildings in their proper proportion, at a lump sum price or a maximum limit of price, the construction of same according to approved plans and specifications within an agreed time, and a guarantee of materials and workmanship over a predetermined period.

5. One company embodying within itself all of the above types of the con-

Proposal

ADVERTISEMENT FOR THE CONSTRUCTION OF CUSTODIAL INSANE BUILDING, COVERED BRIDGE, NURSES' HOME, AND ALTERATIONS TO EXISTING INSANE ASYLUM BUILDING, FOR THE COUNTY OF CAMDEN, NEW JERSEY

Public notice is hereby given that sealed proposals for furnishing labor and materials to construct and equip the following buildings: Custodial Insane Building, Covered Bridge, Nurses Home and Alterations to Existing Insane Asylum for the County of Camden, New Jersey, will be received and opened by the chairman of the Insane Hospital Committee of the Board of Chosen Freeholders of Camden County in the meeting room of the Board of Chosen Freeholders, in the Court House, Camden, New Jersey, on the 11th day of May, 1925, at 2 P. M., Standard Time; 3 P. M., Daylight Saving Time.

All the above mentioned buildings are to be located as shown on a plot plan; on land near Asyla and south of Blackwood in the Township of Gloucester, Camden County, New Jersey, and belonging to the County of Camden.

The work for which proposals are hereby invited, and for which bids will be received covers the complete construction of the above mentioned buildings, including Heating and Ventilating, Plumbing, Electric work, Electric Fixtures.

The right is reserved to accept or to reject any or all proposals or to waive any informality in any proposal presented. All bids must be in sealed envelopes endorsed "Proposal for Insane Hospital Committee" and stating the branch of work covered. No bid will be considered unless accompanied by a certified check to the order of the County of Camden, or cash in the amount of 10% of the bid (in no case to exceed the sum of \$20,000.00) and also a statement from a Surety Company that it will provide the Contractor with a bond, binding the bidder to perform the contract if awarded to him. The terms of the proposal and bond with surety required are fixed by the specifications.

Copies of the drawings and specifications will be on file at the office of the Architect for the purpose of estimating. A limited number of copies of the plans and specifications will be loaned to prospective bidders on deposit of a certified check to the Architect's order in the sum of ONE HUNDRED (\$100.00) DOLLARS for each set of drawings and specifications. These plans and specifications may be obtained by application in person to Walter W. Sharpley, Architect, 225 Washington Square, East, Philadelphia, Pa.

If plans and specifications are returned, cash in the amount of \$90 will be returned, but should they not be returned the deposit may become forfeited.

County of Camden, a municipal Corporation of New Jersey by the Committee of the Board of Chosen Freeholders on Insane Hospital, Maurice B. Rudderow, Chairman.

ADVERTISEMENT FOR THE CONSTRUCTION OF AN ISOLATION BUILDING, INFIRMARY BUILDING, CONNECTING CORRIDORS, AND KITCHEN, FOR THE COUNTY OF CAMDEN, NEW JERSEY

County of Camden, a municipal Corporation of New Jersey by the Committee of the Board of Chosen Freeholders on County Farms, George A. Waite, Chairman.

(Continued from page 228)

struction business, including designing and equipment work, reports that 1924 was one of the best years in its history, and that it is likely that 1925, from the present outlook, will be much better both in volume of business obtained, and in service rendered to its customers.

As a matter of interest, a careful check of figures for the past year shows that the so-called standard buildings were approximately 50% of the total volume of business handled, and that, in spite of a number of down-town developments for warehouse and loft building work, the tendency of industry is very much toward outlying single-story construction.

There are decided trends in the design of industrial plants, according to Frank D. Chase, president, Frank D. Chase, Incorporated. He outlines in this article the present attitude toward plant location, one-story versus multi-story buildings, and such details as roofs, materials of construction, and employee consideration.

THE trend of the physical plant is not behind other industrial activities. Years ago a factory happened or just grew hit or miss. Today, factories do not happen. The modern factory must "fit."

During the last 20 years manufacturers of this country have tended, often at great cost, to the conclusion that the factory is more than a floor, roof, and four walls. The maker of goods on a large scale is gradually moving toward the fact that the physical plant is usually the most important phase of his establishment; that it is in itself the machine in which, and by means of which, his business must be run.

His years of often costly experience now impel the manufacturer generally to accept as the new laws of industry

that it is more economical, therefore more efficient, to find the right location for his plant, to expand his plant horizontally rather than perpendicularly; that sanitation and safety, natural ventilation, and illumination are conducive to dividends; that the layout and type of construction of his factory are determined by the character of the work to be done; that in many instances an old plant physically rehabilitated along scientific lines reduces production costs, and costs less, and often serves better than a new factory; that plants generally are operated more efficiently in the smaller cities than in the very large cities; that mechanical operation is preferable to manual labor; that the placement of any piece of equipment in a plant must bear a pre-determined relationship to other equipment; that the various processes of manufacture, from first to last, must be in proper order and sequence; and that prevision, the ability to anticipate the needs caused by future growth, is an essential to proper development. These are, at the present moment, the various phases of the trend of the modern industrial plant.

The trend toward the right location is one of primary interest, and is noticeable in many industries. "Pittsburgh plus" is responsible for chaos at the moment in the steel industry. The amount of production and of consumption of steel and steel products remain unchanged, but there will be a new line-up of "accounts." This means real sales organization for some hitherto lethargic manufacturer.

The textile industry trends toward the south—changing freight rates, labor supply and markets are responsible for this.

Eastern manufacturers are seeking the mid-west market through local plants. The increased freight rates are responsible for this, in a measure.

A new location means a scientific analysis of requirements. The old days of a bonus by a city are past. Today, alluring advertising of cities' advantages may trap the unwary.

The trend is to analyze the needs of the industry and then fit them to a city or town.

Freight from source of raw-material supply to factory and on finished products to market, limit immediately the geographical location. Then comes suitable land, railroad and trucking facilities, labor (kind and quality) taxes, power, water, sewage, and many other similar considerations, all needing the study of the engineer.

There is only one way in which to expand perpendicularly from a given point; that way is upward, of course. But there are four ways in which to grow horizontally from any point. Modern

industry tends toward or follows the latter method.

The salient thought after birth is growth. When a business is started, one objective is, or should be, to grow. The manufacturer of today heeding the modern trend, pictures his plant expanding outwardly or horizontally rather than upwardly. The former is the less expensive. Horizontal growth of a plant presupposes that the site, that is, the land, is cheap. The reason most plants grow upwardly is that the surrounding land has become too costly to build outwardly. Thus, the manufacturer of today tends to buy tracts of land by the acre, bearing in mind the relation of the location to the supply of labor and of raw material, to fuel or power, to water supply, to transportation, to markets, and to the hazards of fire or flood. The plant which extends horizontally is more flexible than that which rises perpendicularly. It is easier and cheaper, as a rule, to manufacture on a line straight ahead than up and down.

"Industry Learned Its Lesson"

It was not so long ago that no matter how old, unsafe, or unsanitary a building was it was considered good enough for those who worked in it. Then came the perceptible effects of such a course, sick, discontented, impoverished, and maimed men, women, and children. There ensued a popular reaction in the form of laws prohibiting such conditions, statutes holding the employer responsible in part for the welfare of the workers. Industry learned its lesson—the cost of keeping labor well and happy is converted into gain.

Industry today tends ever more in the construction or design and operation of its plants toward natural means of ventilation and light. Its buildings reveal a tendency toward admitting as much sunlight as possible; toward an even, normal temperature, that is, of fresh air; toward safety devices around and on machines; toward the installation of such safeguards against fire as steel doors and fire-resisting windows, fire-proof roofs, partitions and floors, sprinkler systems, tanks, fire companies, and fire-fighting apparatus.

Natural light and ventilation depend on the contour of the building and should and usually can be obtained. There are only occasional instances in which artificial ventilation is necessary or beneficial to the operatives or to processes of manufacture. Proper artificial light sometimes increases production from 15% to 25%. Good lighting, therefore, means a good investment. Good ventilation means greater output.

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

The Editorial, "Tendencies in Building Design," continued from last issue will be concluded next week.

The man who doesn't advertise because he can't afford to "do it right" will never reach a position of affluence because everything worth while in the world had to have a beginning, and there can be no "get there" for the fellow who fails to make a start.

DeBartolmess, 1506 W. 7th St., Wilmington, Del.

BETTER PLASTERING

A nation-wide movement is under way to cause home owners to realize the im-

portance of those parts of a building which are not *seen* but which determine the amount of repairing that will be required and the ability of the structure to resist fire. This educational campaign of the National Council for Better Plastering is designed to awaken an appreciation of plastering as the most important contract in building a home and to acquaint people with the fact that the plastering base, itself unseen, determines the satisfaction the plastered surfaces will give.

To the lather and the plasterer this Better Plastering movement brings a welcome feeling that his work will be brought to the attention of the owner in a more favorable light, with a clearer understanding, and that the present low quality tendency in interior finish will be discouraged.

To our millions of home owners the efforts of the National Council for Better Plastering will point the way to plastered surfaces that retain the beauty of newness and reduce the annual loss of 7,500 lives and \$88,000,000 in property from fires alone.—emphasizing to the owner the importance of the hidden parts of the home and showing why a permanent plastering base is essential in the first step toward a return to that stability we so admire in Old World buildings. This educational campaign is supported by those who are vitally affected by the present low quality tendency.

The completeness with which Better Plastering is being promoted is indicated by a letter which Mr. Oscar A. Reum, President of the Contracting Plasterers' International Association, is mailing to plastering contractors urging that they bid on Better Plastering, even though the original specifications do not call for such bids.

Lathers who appreciate that a permanent base is the only kind worth using, favor Better Plastering. Plasterers, too, prefer to work on a base that does not discredit their art. Plastering contractors are ready and willing to do Better Plastering on a steel base so that their work may be permanent.

It remains for us to influence the final buyer in doing something that is for his own good. Here the architect is afforded an opportunity to aid in a worth while effort to reduce the loss of 7,500 lives and \$88,000,000 in property destroyed by fire, and to give the buyer maximum assurance of freedom from repair and upkeep.

A booklet entitled "Better Plastering" is available to those interested in making the plastered surfaces of the home permanent and safe from fire. A copy will be sent free on request to the National Council for Better Plastering, 819 Madison Square Building, Chicago.

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

"ANTI-HYDRO" Protects This Stucco House Against Wear and Weather

Moisture or frost cannot enter the concrete and crazing or map-cracking have been entirely eliminated, simply by mixing "ANTI-HYDRO" with the gauging water of the cement and sand mortar.

"ANTI-HYDRO" permanently waterproofs and hardens stucco in one operation. It makes portland cement bond securely to tile, brick, or concrete. It may be used with pure white cement or any dry mortar color without affecting the color.

Try "ANTI-HYDRO" on your next job.
Any unskilled workman can use it.

Protecting America

Cyclone Fence has proved the effective means of safeguarding children from ever-increasing traffic hazards around schools. Confines them safely while at play. Prevents dashing into buildings. Centralizes entrances and exits.

With Cyclone "Galv-After" Chain Link Fence, Heavily Zinc-Coated (Hot-Galvanized) by Hot-Dipping Process AFTER Weaving, the investment covers the entire cost of fencing. No annual painting years longer than ordinary fence. Write or phone for information.

Contract awarded Flora Constructing Co., Danville, Va.

The Editorial, "Tendencies in Building Design," continued from April 15th issue, will be concluded next week.

COLOR IN ARCHITECTURE

"Americans are continually criticised for their failure to respond to the artistic or beautiful," said Hazel Adler, notable specialist and authority on color in her address before an audience of architects at the Industrial and Allied Arts Exposition at Grand Central Palace, recently. Miss Adler spoke at the invitation of The Lehigh Portland Cement Company, pioneers in colored concrete.

Miss Adler said in part: "American temperament is supposed to be dominated by materialism and commercialism. How far the environments in which the great majority of Americans live, have influenced their colorless temperaments, may be judged when one pictures in the mind's eye the external atmosphere of a typical American city or town which, to even a tolerant observer, is drab, colorless and uninteresting. American "Main Streets" are the cradles of American temperament.

"In every phase of modern life color now makes its appeal. Our books, periodicals and advertising are all colorful. Our clothing, our vehicles, the theatre and our shop windows outdo one another in presenting to the mind a color picture. As life becomes more colorful in all its aspects, so the visible expression of that life—architecture—must become increasingly colorful and architecture today is at the threshold of a color renaissance.

"The possibilities of architectural color expression offered by reinforced concrete represents the simplest and more responsive avenue of approach. The colors suitable for the body of concrete

structures are only limited by the artistic conception of the architect. There are no decidedly right or decidedly wrong colors. Each color is suitable to a particular architectural type, environment, texture of finish and roof and trim color scheme. The scope of selection is an inspiration in itself. Then, too, concrete color stain is a permanent stain and architects need not fear the havoc to their color selection of sun and weather.

"Colored concrete is not limited to urban cottages, but has even a greater service to offer to residences and buildings in congested cities. In the country, trees, sky, flowers and shrubs offer colorful backgrounds, but in the city where the great majority of our population is located, the majority of waking hours are spent amid the grayed and dingy backgrounds of the city streets.

"Residential blocks of variegated colored concrete, far from being an eye sore, can be made a source of exquisite delight. In a run down, dilapidated neighborhood, only a few blocks away from the busiest business corner in New York City, a group of artists a few years ago purchased two rows of houses on two adjacent streets with back yards adjoining. They remodeled the exteriors of the old structures with concrete and tinted the back walls of the houses in a charming array of soft blues, stone pinks, gray greens and warm buffs. The back fences were removed and a community garden took the place of the individual backyards.

"The selection of the color for the concrete depends on the architectural type of the house, its surroundings and the roof and trim color scheme which is to be used with it. Warm cream and fawn are always a dependable selection. With the cream, several excellent color schemes readily present themselves.

"A brown roof can be used with green trim; a green roof with brown trim; or a red roof with white trim.

"Lichen green, terra cotta red, stone pink, sage-green, venetian orange, all offer interesting and practical possibilities for stucco houses. Each color of course demands artistic discernment in the selection of the other colors to be used with it.

The coloring of the walls becomes the problem of the architect and builder as well as the decorator. A wide and delightful range of colors can be applied to interior concrete walls as well as a wide range of interesting textures."

To be poor in a wealthy country, to be sick in a good climate, to be inefficient among a progressive people, is a sign of unwise educational methods. Such people were not taught to battle with the world or meet life's emergencies.—Thoreau.

Changing an Attitude of Mind

It has been the tendency of the public to look upon insurance as something on which it must first be "sold" by convincing arguments of the insurance man.

That this attitude is undergoing a change is evidenced in the number of people who no longer wait for the agent to solicit their business but who seek out the agent and ask for insurance advice.

By its national advertising the Insurance Company of North America is helping materially to bring about that hoped for time when people will "consult their insurance agent as they consult their doctor or lawyer."

Represent North America.

Boiler Ratings Abandoned!!

Novelty Boiler Selection Plan Eliminates All Guess-work

AT last you can buy a boiler and know what you are getting!

All the uncertainties that have upset the calculations of architects, heating engineers and heating contractors in the past twenty years are removed.

The Novelty Boiler Selection Plan is a scientific method of determining the *exact* size boiler required under given conditions. It is as simple as it is sure.

No need to remind you of the increasing confusion caused by the irregularities of present boiler ratings. Without any uniform standard or any safe means of comparison, manufacturers can fix arbitrary figures that are actually misleading. So how can anyone estimate boiler capacity with any accuracy?

Many of you are aware that this absence of any standard of comparison makes it pos-

sible for unscrupulous manufacturers to charge exorbitant prices by rating their boilers far in excess of their true capacity.

To bring order out of this chaos, the Abram Cox Stove Company, manufacturers of Novelty Boilers and one of the pioneer boiler makers of the country, evolved the Novelty Boiler Selection Plan. Everyone who has seen the plan is enthusiastic over its simplicity and accuracy and wonders why it was not thought of before.

Briefly, this plan is based on selecting a boiler by the dimensions of the flue. Complete charts, carefully compiled, show that by using a Novelty Boiler of a given size with a flue of a given size, all the other factors that enter into the selection of a steam or hot water heating boiler are automatically correct. Proper balance of boiler and flue insures perfect coordination all along the line.

Send for the new Novelty Handbook. It will show you in convincing detail how effectually this method operates, and it will enable you to select quickly the exact boiler you need for any building. No calculations on your part are necessary. It is all worked out for you in tables that represent the labor of months. Address Dept. BG-5, at nearest office.

VAN SCIVER

for Contractors

Operative-Builders Should Demand Van Sciver Products

Each of the specially prepared Knickerbocker Lime Products is the very best obtainable for the use intended. They are all the result of years of research and practical experience.

Plastering sand, concrete sand and graded gravel, mined and cleaned by the most modern methods, are always of uniform quality.

It is a decided advantage to be able to secure all of these materials from one reliable source.
